>Lenght of SCSI cables?

Ok.

>Termination ok? Only the last physical device can be terminated.

Yep.

>Older releases of ICD adaptors/drivers are not compatible with
>AHDI/HDDriver?

I have 6.5.5. I can't see that this is the problem because it works with all devices individually. And when I tried a demo of HD Driver it gave the same results (indicating that the problem is on the chain itself, not within the software)

>One device, one SCSIID. Maybee atari use ID7, MiniS used ID0, ZIP used
>ID5 and so on..

Yes, this is fine. MiniS =1, Zip =5, CD-R =2, Atari whatever it is (6 or 7)

>Without any other device, MiniS use an terminator on the second scsi
>plug? If not, the mechanism is internal terminated. (Jumper !)

Internal termination jumper removed. When drive is the only device, I use a terminator on the second SCSI port. When other devices are on the chain, the last device is terminated (either using a terminator or hardware termination switch).

The weird thing is that the chain goes like this:

Atari ---> Link ---> MiniS (ext. or int. terminated)

...this works fine.

Atari ---> Link ---> MiniS ---> Zip ----> CD-R (hw terminated)
Atari ---> Link ---> MiniS ---> Zip (ext terminated)
Atari ---> Link ---> MiniS ---> CD-R (hw terminated)

In these combinations, data throughput from the Atari to the Zip/CD-R is fine, even though it's going through the MiniS first. It's only the data from the MiniS that's getting corrupted.

>Remove internal termination, if it�s active, connect your other devices
>and use termination on last device.

Yep.

>You chain contains homebrewed SCSI cables? Remove that..
>Replace it with quality SCSI wires..

Nope.

>Some ZIP devices needs an active TermPwr on SCSI Bus (Pin 38)
>That track contain +5V, supply for terminator packs..

This is Ok - termpwr is supplied by either the Maxtor or the CD-R drive. It's easy to see what's providing termpwr as the LED on the Link lights. Now I've added the CD-R to the SCSI chain, things work fine even if the HD is turned off and still the first device in the chain (as the CD-R will power the Link).

The only thing I haven't been able to try is putting the HD in any other place than first on the chain, because of cabling difficulties.

So, I've tried (for a long time) to get this to work, and I've done all the obvous stuff, and it still doesn't work. That's why this thing has been such a *&$%*�*^%...

Thanks Robert,

Greetings,

I was wondering if anybody knows wether Atari ever produced a Finnish keyboard layout for the MEGA keyboard? I recall reading in CHIPS555.HYP (an Atari technical FAQ by Michael Ruge) that there was one for STE, but there is no mention of any MEGA version.

Btw, does anyone have any details as to which TOS versions had Finnish keyboard support (presumablty 1.06 or 1.62) and if any ST/TT/Falcon were ever built with Finnish language version of TOS?

Thanks.

Here's an example of my SCSI problem:

I just downloaded the HD Driver 7.7 demo, and here's the result of a ID scan with just the MiniS connected (demo HD Driver installed):

```
HDDRUTIL 7.73 IDCHECK:

ACSI 01.00: MAXTOR  7213-SCSI       7442  Direct Access
```

And here's what happens when I add a terminated Zip+...

```
HDDRUTIL 7.73 IDCHECK:
```

```
ACSI 01.00: IXTo_  7337-WCSY       7442/  Direct Access
ACSI 01.01: AxTOrb 7213?SCSIi      7446-  Direct Access
ACSI 05.00: IOMEGA  ZIP 100 PLUS    J.66  Direct Access
```

I just had a thought: could this happen if the MiniS is partitioned to C (boot), D, E, F and G, and the Zip is also partitioned to "C" as well (because when I partitioned the Zip, the hard drive wasn't working on the chain)?

> I have an STE, connected to a MiniS SCSI hard drive (Maxtor mechanism) through an ICD Link 2, which works fine. However, when I plug in any other device on the SCSI chain, the MiniS gets garbled (ICD, and an older HD Driver demo both report it's name with garbled characters - data transfer is just as garbled).
>
> For a long time I thought it was my Zip Plus corrupting the chain, but any other SCSI device does this, so it must be a fault in the Maxtor mechanism. I've tried every combination of SCSI termination and tried all the various jumper settings in the drive, to no avail. Any clues?

Have you tried putting the MiniS at the very end of the chain? And is it terminated? You could try unterminating it - theoretically wrong but it sometimes works. Where does the Link 2 draw its power from? If more than one device is suplying termpower, it may be that the MiniS lacks an isolating diode and that is the cause of the problem?

Regards, /Peter/

Is there such a thing as a SCSI floppy drive? I haven't heard of one (but then I'm not used to non-Atari gear). Provided the floppy controller chip is up to it, the modification for swapping the 720 KB drive to a 1.44 MB one is *very* simple - just a chip and a few wires, with one leg of an existing chip being cut and bent up. But don't forget to set the step-rate to compensate for the clock doubling.

Yes, first i think you use older releases of ICD drivers.

That�s ok. Must be another problem.

Hm, SCSI chain looks ok, any line. Wondering that data on the first
device are corrupted. Maybee also a good sign for bus trouble.
But how..
Can�t see any mistake.

> This is Ok - termpwr is supplied by either the Maxtor or the CD-R drive.

OK. Sounds good.
Another (stupid) idea. SCSI ID selektor on you new device is correctly
wired? You got another ID as shown in ID window if the connector of
the ID selector is connected wrong. (Fliped connection)
(Double used IDs!)

I don�t know, but your problem smels like double IDs or some else in
that direction.

> The only thing I haven't been able to try is putting the HD in any other
> place than first on the chain, because of cabling difficulties.

Right, but thats are secondary. Normaly evry device works on and place
in any SCSI chain. Normaly, but.. :->

On my falcon chain, the ZIP only works correctly if it�s the first
pysical device (ID5) All other devices, hard drives, CD-ROM, Burner
follows after this bloody ZIP. Same on PowerBook. Only with a desktop
Mac i can use that bullshit drive how ever i want in a SCSI chain.

Only a idea..
Try ZIP as first device, other devices after your ZIP?

Regards, Robert

I you allready have a logical device "C" on your desktop, you can�t use
another drive named "C", that doasn�t work with any driver.

Scrambled hard ware messages looks like bus trouble!

Maybee SCSI bus is not correct terminated.
Try to use the ZIP not as last device.

Also the ZIP+ manual says: connect it only with the cable what
comes with the ZIP, right?

>more than one device is suplying termpower, it may be that the MiniS
>lacks an isolating diode and that is the cause of the problem?

The Link gets it's power from the MiniS. The Zip doesn't provide termpwr, so there's only one termpwr device on the chain (unless I add the CD-R in, as that will supply termpwr and power the Link, even if the MiniS is switched off).

Hi Robert,

>Yes, first i think you use older releases of ICD drivers.

6.5.5 is the latest version. I just checked their website and they say they have beta version7 drivers in development, and are offering 6.5.5 (pro) at a cheap price.

In any case, the data looks garbled with HD Driver 7 demo, so I don't think it's the driver software.

>Another (stupid) idea. SCSI ID selektor on you new device is correctly
>wired? You got another ID as shown in ID window if the connector of
>the ID selector is connected wrong. (Fliped connection)
>(Double used IDs!)

Not a stupid idea at all. I've tried a number of Id's and it doesn't make a difference. Anyway, all driver software reports the MiniS on the correct Id, so that should be Ok.

>I don�t know, but your problem smels like double IDs or some else in
>that direction.

Or (as I'm begining to suspect) a hardware fault in the drive itself.

>On my falcon chain, the ZIP only works correctly if it�s the first

>pysical device (ID5) All other devices, hard drives, CD-ROM, Burner
>follows after this bloody ZIP. Same on PowerBook. Only with a desktop
>Mac i can use that bullshit drive how ever i want in a SCSI chain.
>
>Only a idea..
>Try ZIP as first device, other devices after your ZIP?

This is more compilcated, as firstly I do think I've ever found the correct SCSI adapter to do this, and secondly, as the Zip is a *&$^* Zip Plus, you have to use the cable that comes with it, as it's this that tells the Zip whether it's a SCSI or parallel connection. In practical terms, this means it's difficult or impossible to make the Zip the first device in the chain.

(And before you ask, it's not the Zip Plus cable corrupting the chain, as this corruption occurs when the MiniS is connected to my CD-R, without a Zip on the chain).

>> I just had a thought: could this happen if the MiniS is partitioned to C
>> (boot), D, E, F and G, and the Zip is also partitioned to "C" as well
>> (because when I partitioned the Zip, the hard drive wasn't working on the
>> chain)?

>I you allready have a logical device "C" on your desktop, you can�t use
>another drive named "C", that doasn�t work with any driver.

No, I meant that both drives were independently partitioned as drive C. Remember, when one drive works, the other doesn't (great for backing up, eh?)

So in order to partition a drive, the first partition gets written as C. What I mean is, if I had two Zip drives, with disks partitioned as C, if I connected both drives on a chain, would this cause an error, or would the second drive get installed as "D" or something..?

> Scrambled hard ware messages looks like bus trouble!

Yup. But why..?

> Maybee SCSI bus is not correct terminated.
> Try to use the ZIP not as last device.

Tried it. Used Yamaha 4416 CD-R with hardware termination. Still the same symptoms. Also the same same symptoms with just the MiniS and CD-R on the chain. Basically, as soon as any other SCSI device is added to the MiniS, the bus gets corrupted. This would point to termination in the MiniS. I'm wondering if the internal termination is broken and permanently on? Could this give the symptoms I describe? If this was the case, why are the devices _after_ the MiniS working correctly?

If the MiniS was the only device on the chain, and it was _un_terminated, would it still work? (I'm trying to work out ways I can narrow down the problem). Are there any SCSI diagnostic tools which can help with bus problems..?

How would one modify the STE to work with 1.44 meg floppies ?
    Would the mod work on external drives as well ?

I've tried both inside the MiniS. For the Zip, or the CD-R, there's nothing (I'm aware of) that enables you to change this.

Accessing Atari ST Formatted Floppy Disks

Old versions of TOS had a bug that caused them to format floppy disks incorrectly. This bug prevented IBM PCs from reading Atari floppy disks,

even though Atari computers could read MS-DOS disks.

The problem was corrected in TOS 1.4 and later versions of TOS. However,
you may still have some disks formatted the old way.

There are three ways to read information from such disks:

1. Format a blank disk on the PC and then use your Atari computer to
copy the files from the old disk to the new disk. Once copied, reformat
all
your old disks.

2. Activate the Atari Disk Mode option in Gemulator 98. This will allow
Windows 95 to read the Atari disks and you can then use the PC to copy
the
files from these disks onto freshly formatted disks. Note: this trick
only works on Windows 95. Windows 3.1 and Windows NT are more picky and
can
only read real MS-DOS disks.

3. Use an Atari ST utility such as DC Formatter or MOSDOS to re-write
only the boot sector on the floppy disk. This fixes the disk without
reformatting or losing any information. We supply the utility MOSDOS in
the UTIL folder of the Gemulator 98 program disk.

>>but it sometimes works.

One thing: the drive works fine even if it's unterminated and there's no terminator or other terminated device connected. Is this normal?

There are two resistor packs that control termination on the drive, and both are removed (by myself). As the drive works fine even when unterminated, perhaps there is something wrong with the drives termination?

```

To me this looks very much like a problem with either cables or termination. Yes, I know that this is nothing new and has already been suggested. Looking closely at the output it seems as if certain bits are corrupted. This can also happen if a cable is not properly stuck into its socket.
Anyway, it's definitely no software problem but clearly related to your hardware.

Yes there is. Teac used to make a 1.44/2.88 Mb SCSI drive.
I tried one on the ST, but I never had software to use it.

>Provided the floppy

Yes, this is the best way to get 1.44 Mb. You do run a small risk of killing your controller, but it's probably work the risk.

Ajax chips were always too expensive.

The access time doesn't depend on the partition size.

I don't think you can deduce something from this. Sometimes drives do
work even when not being properly terminated.

This depends on the TOS version. It's at least 256 MByte. With TOS 2.0x
and newer it's 512 MByte, with TOS 4.0x it's 1 GByte. With MagiC or
Big-DOS or MiNT it's also 1 GByte.

There are also some hardware limitations with drives & host adapters.
I believe the older (non ICD) host adapters, when used with AHDI, were
unreliable with drives greater than 1 Gb, even if your partitions are smaller
then 1 Gb

I think this problem is fixed for all new adapters (ICD, LINK) & newer drivers
like HDDriver.

No, it's 512 MByte with TOS >= 1.04. At least it is when partitioning
with the software included in the HDDRIVER distribution.

No, that's wrong. With adapters and/or drivers not supporting drives > 1
GByte connected to the ACSI bus you simply can't use any sector that is
located beyond the 1 GByte limit. There are no other problems except
this one.

Great, I had assumed there was some sort of bit overflow/wraparound & the drive would be reported as much less than 1 GB.

Thanks for clarifying the issue.

I'm beginning to suspect the Zip Plus cable. This is a sort of hybrid SCSI/parallel cable that's _supposed_ to work as either. However, I plugged a normal parallel cable into the MiniS (not reccommended, I know!), and the symptoms were similar (although a bit more severe).

So I think that some of the cabling for the parallel part of the cable is interfering with correct SCSI operation. Does anyone know if the Zip Plus will work in SCSI mode with a regular SCSI cable?

It has to work if the drive is SCSI-compliant.

No, it's simply that some sectors cannot be addressed. Under rare
circumstances using AHDI on such drives can be dangerous, though. If you
have connected several drives to the ACSI port and try to address a

sector beyond the 1 GByte limit AHDI will incorrectly set up the parameters for the SCSI call. This can result in the wrong drive and wrong sector number to be addressed.

The Zip+ is known to make problems more often than to work correctly, regardless whether used on PC, Mac, SGI, Atari, or any other platform. At least for some time, Iomega therefore offered people with such problems one SCSI Zip _and_ one parallel Zip in exchange. Dunno whether this is still the case.

Ciao

Thomas

Sounds like this could overwrite partition information or data on other drives, it's not worth risking, even if the chances are remote.

At best, you suffer TOS error 35 when loading programs; worst case, you lose access to a whole drive.

The partition information on a disk does not hold any info like C:, D:, etc. although it may hold an ASCII partition title (if the software allows it). The partition letters are assigned dynamically by the operating system in the order that the drives come on line and/or are detected by the SCSI bus scan. This usually means in ID order.

>Are there any SCSI diagnostic tools which can help with bus
> problems..?

They are a bit rare for working at this level - most of them just do read/write tests of connected drives.

You could try to find the SCSI.PRG which comes with the ICD-Pro package. This allows individual SCSI commands to be sent and the response examined.

You must be careful though as you can easily wreck a HD if you use some of the more exotic commands.

From what you have said earlier I would guess you had a cabling problem (yes, I know you have tried all permutations!). Don't believe all you hear about "termination rules for SCSI" - it's what works for you that matters :-)

Ha! ..... and some don't work even when they are! (I'm thinking of problems with the TT bus) It's all a big mystery.

It's a straight pin to pin DB19 cable, but it must be shielded and short.

Hi

It's a standard DB19 straight through plug. Most GOOD electronic
component shop do them.

```

Sounds like a normal Atari DMA cable..
Male DB19 to female DB 19.

Pinout? -> DOIT_ST

>
>It has to work if the drive is SCSI-compliant.

Yes, but the Zip Plus is a sort of hybrid - it uses the actual autodetect cable to determine whether the connection should be a SCSI or parallel one. The socket on Zip isn't necessarily a SCSI _or_ a parallel one, but possibly a proprietry format. This is why the manual says you should always use the autodetect cable and nothing else (and part of the reason cabling the thing up on the Atari has been a pain...)

I was just wondering if anyone had connected a SCSI device directly to a Zip Plus with success, before I spend _another_ 30 quid on cables that may or may not help.

(Thanks everyone for the input on this BTW, I really appreciate it!)

>this is still the case.

I'm beginning to think it would be cheaper and easier to buy a SCSI Zip. Great! I buy a Zip Plus because I couldn't get a normal SCSI one (only parallel), but this should work. I also have a parallel one here (my girlfriend's), and I resent buying a _third_ (!) and giving _more_ money to Iomega for something that should've worked in the first place... :(

Firewire looks like a good idea to me (join the Nuke SCSI brigade..!)

I tried modifying my STE for the 720k - 1.44mb swap... but the chip I soldered
together
didn't work. So I modified it again to work like it used to. I've seen various
SCSI
1.44mb diskette drives on Ebay from time to time. I've done my research and the
TEAC SCSI
drive model numbers are:
FD-235-HS-711
FD-235-HS-715
FD-235-HS-911
FD-235-HS-918
FD-235-HS-1011
FD-235-HS-1111

My question is, would I need special drivers? Or could I trick ICD into thinking
I had a
1.44mb hard drive?

Thanks,
Andy Blakely

I don't have the details to hand, but The Upgrade Shop sell a High
Density module for �25 + PP with full instructions. You can contact by
Email: dave@tusdev.demon.co.uk and there is also a web page
http://www/tusdev.demon.co.uk

Yes, it can work with external drives too, but (depending on whether the
HD-select switch in the drive is connecetd to the cable) you may have to
run an extra wire from the external drive to the computer. The module is
accompanied by software AUTO programs that you use to tell the computer
whether internal, external or both drives are High Density.

There are vairous species of floptical around...I have an Iomega one, use
it for back-up and it conveniently gives me a 1.44Mb floppy as well..use
with a Link2, ICD just sees it and plays, gotta be the simplest way...tried
the internal converrsion things and got one working, but the otehr one
won't handle 1.44's...OK with 72o's though...

Hi!

Now that we are on the subject of SCSI!

I have the above controller. It recognizes only the HD, but nothing else.
IDCHECK doesn't find anything else. I have set my creative labs 2x CD ROM
to ID 1. HD is ID 0

This is a three connector cable I am using, after plugging into the card.
Is there a priority I should follow? I am planning on getting a syquest
44MB drive, carts, and a 340 MB HD. Help! I would like to see my system
recognize all this! System is a 4MB 1040STe.

Jim

No, the partition letters are assigned by the hard disk driver. And with
a driver like HDDRIVER the user can influence how letters are assigned.

I can't comment on the ICD software but with HDDRIVER SCSI floppy drives
connected to the SCSI bus should work just like you can use LS-120
drives as floppy drives with HDDRIVER.

Hi. I am a spanish journalist and I'm looking for photos for a report of
Atari Pong, Atari VCS 2600 and Atari ST. Does anybody have any or any
direction to download? Thank you very much.

Hi Jim;

I've got the same card, and when I first got it, I spent 3 days screwing around with it trying to get it to work., I reformatted it partitioned it, every thing I could think of. It just about drove me nuts! Then someone told me to turn on the HD first, wait for 10 seconds or so (you'll here a sort of whirring noise when it initializes) and then turn on the system. Sure enough, everything went fine after that. I wish I'd known that before I pulled all my hair out...

Hope this works

Chris

The Zip Plus has some automatic on board for knowing when to parallel
and when to scsi. Is decided that the latter is OK then an automatic
'need for termination' is figured out.
So this can lead to 0, 1 or 2 terminations, depending on your
hardware.

Some people have the experience that it only works with the supplied
cable.

Hi,
Im trying to link an old Apple SCSI CD-ROM drive
to my Falcon. The SCSI drive works fine on my Mac,
and Ive got the right cables (I think) for the Falcon.

Everything links up fine, but Im assuming I need some
kind of driver software for the CD drive? Does anyone
have any recommendations (shareware and/or commercial?)

Cheers

Bob

I wouldn't worry to much about it not seeing the CD-ROM drive, as long
as the CD driver you are using sees it.

Metados 2.7 (2.72?) works well..I use it on Flacons and St's with no trouble, it's free too....Anodynes Extendos is a bit simpler to set up (it has an installer routine) but costs money :-(...If you tell me what drive letter you want assigned to the CDROM (I suggest P if you are using TOS) and which SCSI ID it is located on (unless you need it for something else then I suggest ID5 or 6) then I can send you a ZIPfile of everything you need, with all the set-up done, you just copy the fiels where the README tells you to ...

I am looking to expand my midi outputs thru the serial port rs232. I am using cubase 3.10 and it includes drivers to do so but the devices for this are not available.Does anyone know of a device that I can do this with for the 1040. I really need to expand my midi output.

Thank You!!!!

This drive might expect a SCSI host adapter supporting parity. The internal adapter of the MegaSTE doesn't support this. If there is a jumper on the drive you have to switch parity checking off. If there is no jumper and it's a parity check problem you can't use this drive.

> Thus i trying to install an other SCSI disk MAXTOR LXT213SY (200Mo) and the

You should try another hard disk driver just to ensure that it's not simply a software problem. Try the demo version of HDDRIVER:

http://home.nikocity.de/nogfradelt/atari_english.html

Mine worked fine with ExtendDOS Pro. Should be able to buy it at Systems
Solutions or any good atari dealer. Many here are using MetaDOS and
SPIN, but haven't tried either.

Hi David;

Did you try turning on the Hard drive first, waiting about 10 seconds
```

(listen for a whirring sound as it initializes) and then turning on the computer?

I have a SCSI drive on my 1040STf and that's the only way it will recognize it.

Good luck
Chris

As long as the conservatives and liberals both run on motorola
processors and boot TOS, I guess so.......

Eric

Umm... we need more details...what are the symptoms?...You say it is recognised...I guess with AHDI that is a good sign... is there an icon for it on the desktop?...You have TOPS 2.06...try doing a Control C from the desktop and see if it brings up the drive....all else failing use HDX to see if you can partition the drive ...go for a boot partition of about 10Mb and the rest in a couple of equallish parts...Try HD-Driver (get the language version you understand)...If you are going to try another drive, remove the original one and set the new one to ID0, disable parity and make sure it's terminated...

>I tried one on the ST, but I never had software to use it.

Last year I found one of these (or similar) on a flea-market. Without any documentation, of course, and with about 15 unknown set-up jumpers on the unit. It was a Teac HF-235-something with additional SCSI board below the drive, and a nice Atari-gray face mask. The 34-pin connector on the drive was slightly modified (some ground pins reconnected) to alow the SCSI board to get +5V power through it from the drive.

I did not know this might be a 2.88MB drive! I could not find any info on this particular variant of HF-235.

I tried to add it to my SCSI chain and it ALMOST worked. I concluded that with proper software (HDDRIVER maybe?) it would work OK. I tried the drive with ICD and Hushi drivers/formatters and had partial success:

On of these packages agreed to format the drive, but then would not read/write to it. The other package would not format it (the formatting utility did not recognize drive's presence in the chain), but then it would read/write to it if the drive was formatted by the other package. Weird.

The inconvenient detail was that the package that wanted to format the drive (I think it was the ICD) insisted that it was a removable hard disk, and always partitioned it, making a master boot record and partitioning info- so not compatible with the standard floppy format, I think.

>>Provided the floppy

>
>Yes, this is the best way to get 1.44 Mb. You do run a small risk of killing
>your controller, but it's probably work the risk.

Well, in the end I disconnected the SCSI board from the drive (so now I have this surplus board), reconfigured the 34-pin connector back to normal, and replaced my internal 720KB drive with this drive. I have a WD1772-02-02 controller chip, and I the adapter that I made was based on Martin Graiter's elegant single-chip design; perfect, especially if you have only one drive, very few wires to connect. I just modified the adapter design so that the controller chip was on 16 MHz only when HD was inserted AND the drive was really doing something- detected using the MOTOR ON signal from the controller chip. So the overheating is minimal, as the controller is on normal 8 MHz almost all the time. It works perfectly, always.

So maybe it would work even for people having a WD1772 without the 02-02 (wigher temperature range) suffix?

This drive gives "HD-inserted" signal even when there is NO DISK in the drive- so in fact this is a "DD-not-inserted" signal :) and to prevent the controller chip from being overclocked without need, I used this MOTOR ON signal.

Cu.

Hello,

I have a MEGA STE and the hard disk inside don't works fine but it is recognised !!

Thus i trying to install an other SCSI disk MAXTOR LXT213SY (200Mo) and the MEGA STE don't recognize it with the HDX.PRG and HDINSTALL.PRG utilities.

How can i do ?
Is there a special disk for MEGA STE ? (i don't think because the interface is SCSI)

HELP HELP HELP !!!

best regards, David

There is only one version of HDDRIVER that supports both the German and the English language. The language used for the manual differs, however. So ensure that you don't get a German version in case you don't understand German. As far as I know there is at least one company in England that sells HDDRIVER with its German manual. If you want to be sure that you get an English manual you should buy HDDRIVER from System Solutions. They translated the German manual and have the copyright for the English manual.

Thanks for your help !!

I don't know if the disk is terminated and i don't know witch jumper i must change to disable the parity !!
(i'll try to surch a documentation about it, but it is a old disk (200Mo))

The symptoms are the disk turn on (the rotation is true and the heads are unparked !!) but it is not present on the desktop and the HDX program don't want to format it or partition the drive !!

How can i do something ??

best regards, David

It should definitely *not* be terminated! Some drives might work even with termination enabled, but most don't and if you have really bad luck you might even damage the SCSI-adapter...

Getting a SCSI-drive to work with a Mega STE or STacy is not easy, there are several things you have to take care of:

* As I said, the drive must *not* be terminated. It's easy to see if your drive is terminated; most (if not all) older drives use resistor packs which you'll have to remove. These resistor-packs are usually located right next to the SCSI-connector.

* The drive *must* have SCSI ID #0. If you want to change it's ACSI-ID you must do so on the SCSI-adapter, not the drive.

* You can't use drives with parity enabled (OK you can but that requires some hacking). Parity can usually be disabled by removing a jumper (normally called "EP" on Quantum-drives).

> (i'll try to surch a documentation about it, but it is a old disk (200Mo))

Try www.pc-disk.de, I'm almost certain that you can find the specs on your disk there.

Correct...

and make
> sure it's terminated...

No. It *must not* be terminated, the MSTE/STacy's SCSI-adapter is not
designed for this. It will work with some drives (like the Seagates
originally shipped with these machines) but most will not. All drives
works with parity disabled (if you can disable parity that is).

A few years ago I read a piece about how to swap drive A and B on STs
with internal drives. I have a STE with no internal floppy now (there's
a harddisk there instead), and want to use an external floppy as drive
A.

However, if I simply plug in an external floppy it does not work, the
STE believes there's an internal drive A present but no external. How
do I hack the STE to get this working? IIRC it had something to do with

the internal drive-cable, but I'm not sure if this will work when there's no internal drive. Also, it's possible that my external drive (an ugly device from Power Computing) is hardwired to act as drive B.

Any suggestions anyone?

As already indicated if it's parity you can't do anything than turn parity checking off. HDX is old and doesn't work for some drives. Try an alternative, e. g. HDDRIVER.

Never mind, go to Maxtor instead :-)

ftp://ftp.maxtor.com/pub/scsi/7213s.txt

According to this you should remove the jumpers J307, J308 and J309 to
set it's ID to 0, and enable jumper J303 to disable parity. And don't
forget to remove those resistor packs if present.

But with this host-adapter it's possible that not even HD-Driver will
work correctly. I have a 52Mb Quantum LPS in my STacy, and HD-Driver
7.12 refused to format or partition this drive (HDX too). I had to put
the drive in my Falcon to partition it.

Also, HD-Driver doesn't autoboot on my STacy, I have to boot with AHDI
and put HD-Driver in the autofolder.

I remember this problem when I put my STFM in a tower case.
AFAIR, the external drive connector socket (on the back panel) does not have
the select line for the "A" drive. Also, the internal drive "A" cable is not
wired to select the "B" drive either.

>However, if I simply plug in an external floppy it does not work, the

You could swap the drive "A" select line from the internal motherboard
connector to the external connector. Cutting one track & a short piece of wire
should be all that's needed. You could also swap the drive select lines which
come from the PSG port. Do you need details?

Also, it's possible that my external drive
>(an ugly device from Power Computing) is hardwired to act as drive B.

This is possible, many drives in the PC world are hard wired to act as drive
"B", & a twist in the cable reverses the drive select lines between the "A" &
"B" drive connector.

Examine the drive, perhaps the drive select jumpers are labelled "DS0" or
"DS1" , use "DS0" for "A" & remove "DS1".

On the external floppy port, pin 5 is /DRVSA and 6 is /DRVSB- a simple
flipflop on those two may be the ticket if the external drive is
hardwired "B". But the problem of shutting up the internal drive saying
"Auuuuugh! I don't have a drive here!" is solved thus- pins 13 (/DRVSA)
and 33 (/DISKCHG) need to be connected. What this means is that when
the amiga polls the disk drive to say 'Hi! Are you there and is there a
disk in?' it says 'Hi back to you- yes I am and no there isn't.'

This was cribbed from HappyHardDrive.LHA, an Amiga hack. Who sez Amigas
are all bad?!

HDDRIVER is commercial software. You can purchase the German version
from me, the English one from System Solutions and the French version
(French manual) from Promethee:

http://home.worldnet.fr/aspromet

I would have to agree. Also as an alternative would be the intel NIC's as well. This would also give a fall back. I think if we could get one working, I would bet that the other drivers would be a snap to get. It's just that inital hurtal to overcome.

This is a good idea. I think that if we could design a cartrage "chamber" say, that allows for say 1 or more ISA slots, with a passthough built in for use of a cartrage.

I also think we are now talking more about porting over standard ISA to the Atari platform more than anything....but this does raise some good questions. If it is possible to port a standard ISA network card....what is stoping someone from porting other ISA card products over.

Ah, that's an idea. I didn't think of this, but now that you mention it it
sounds like the obvious solution. I think I have the schematics somewhere
so I think I can work it out.

The drive itself is an Epson SMD-380, the one that originally was in the
STE. It's possible that I have to swap the select-lines though. Thanks for
the tip.

In this case wouldn't a PCI port be more sensible?

Thanks,

I have found the spec of my HD, and the spec you have found are bad, the
reference of my disk are MAXTOR LXT213SY.
Thus i have set the jumper to have : No parity , ID=0.
There are no resistor pack.
BUT BUT HDX don't recognize it and i don't have an other SCSI disk manager
to try to install the disk !!
This disk is alone on the SCSI chain (with the host adapter as well)

HOW can i do ?
where can i found the HDDRIVER (not in demo mode !!) ?

best regards, David

Deskpic doesn't like NVDI, and I thought it used GIF's...I used it before
NVDI.....now I don't, it certainly worked on an STe....I'll hjave a fiddle
maybe it's an autofolder issue...

You might look for a used Syquest drive  (44, 88 or 135 meg drives and
something like a ICD Link 1 or 2 as a host adaptor.)  Works great on
an ST.

Mario Becroft at http://www.ak.planet.gen.nz/~mario/ sells an adaptor which will allow an IDE drive to be fitted to an ST. The driver is $NZ150, which is around 50 pounds, plus postage. On top of that, you have the cost of a drive. Using Mario's adaptor a 2.5" laptop drive can be fitted inside the STe's case, or you can use a free standing unit outside the case. The adaptor fits in the cpu socket and comes with an upgrade to tos 2.6

The Atari Software eXchange

Updated: Saturday 17th July 1999

I have the following Atari gear for sale. Prices do not include postage.

Prices are in GBP's (Sterling) and I'm also willing to accept USD's.

As usual I will consider part exchanges or swaps for other Atari St, Jaguar, Portfolio etc. hardware or software.

Things I'm on the lookout for:
Atari CD-ROM's, reference books, EPROM Programmer that can do 32-pin DIL chips.. or anything that tickles my fancy;)
****

Atari ST Compilation Packs
Atari STE Discovery Xtra Pack, featuring:
Final Fight, Sim City, Escape from the Planet of the Robot Monsters, 9 Lives and the Language Disk. ..... �5

Atari 520STE Turbo Pack, Featuring:
STOS, Hyperpaint 2, Music Maker 2, FirST BASIC, Blood Money, Anarchy, Human Killing Machine, Impossible Mission, Dragon's Breath, Indianna Jones and the Last Crusade, Outrun, and Super Cycle. ..... �15

Compilations
�3 Each
Top Shots, featuring: Kick Off + Extra Time.

�4 Each
Hollywood Collection, featuring:
Ghostbusters II, Indiana Jones and the Last Crusade & Robocop. No Batman or instructions.

�5 Each
Champions, featuring:
Manchester Untied, World Boxing Championship & Jahangir Khan Squash. No Box.

TNT, featuring:

Xybots, Toobin, APB, Dragon Spirit & hard drivin'.

Mega-lo-Mania & First Samurai.

Educational
�4 Each
Learn to Read with Prof. Level 1. Ages 4 to 9. Not STE.
Mickey's Runaway Zoo (Disney Software) - Learn Numbers for 2-5 years.

Adventure, Strategy, Puzzle & Trivia type
�1 Each
Spidertronic

�2 Each
Crash Garrett
Go-Moku/Renju
Quizam!
Skweek
The Quest for the Time Bird
Tower of Babel

�3 Each
Advanced Dundgeons and Dragons 'Heroes of the Lance'. No box.
Borodino
Chess Player 2150
Corporation
Curruption. No Box.
Driller. Including a model of the planets surface.
Dungeon Master Editor. No box.
Dungeon Master Expansion Set #1 - Chaos Strike Back & Utility Disk.
Federation of Free Traders (F.O.F.T.). No box.
Lords of Chaos
Murder

�4 Each
Operation Stealth

�5 Each
Carrier Command
Kings Quest I. No Box.
Kings Quest II. No Box
Kings Quest III. No Box.
Buy all 3 Kings Quest Adventures for �15 inc. postage (UK only).
Leasure Suit Larry in 'The Land of the Lounge Lizards'.
*** WARNING ***
Leasure Suit Larry contains ADULT Material.
Parental guidance is suggested.
Powermonger including World War 1 edition
Shadowlands
Space Quest. No box.
Terrorpods

�7.50 Each
Civilization. 1 meg. No Box.
Midwinter II Flames of Freedom. 1 meg.

�10 Each
Frontier - Elite II. 1 meg.
Indy - Indianna Jones and the Last Crusade 'The Graphic Adventure' (6 disks). I've no idea if this needs 1 meg! It comes with The Arcade game as well.
Populous II. Both 1 meg and 512k versions.
Railroad Tycoon. 1 meg.

Simulations
�2 Each
Hunter Killer

�3 Each
Falcon The Mission Disk Volume 1.

�5 Each
Battlehawks 1942
Falcon. The F-16 Fighter Simulation. �7 including Mission disk 1.
Flight of the Intruder. Additional Features for 1 meg owners.
Gunship
Mig-29 Fulcrum. 1 meg needed.

�7.50 Each
Formula One Grand Prix (Microprose)
M1 Tank Platoon

�10 Each
F-19 Stealth Fighter.
Knights of the Sky. 1 meg.
Reach for the Skies. 1 meg.
Silent Service II. Requires 1 meg.

Sports
�2 Each
Football Director II
Hyperbowl. No Box.
Super League Soccer
World Cricket

�4 Each
Kick Off 2 + World Cup 90

�5 Each
Sensible Soccer. 1992/3 Season Edition. Computer Game of the Year '93.

�10 Each
Championship Manager End of 1994 Season Data up-Date disk. Comes with Championship Manager (1 meg) and Championship Manager Italia. Altogether 8 disks.

Arcade
�1 Each
Nitro Boost Challenge

�2 Each
Alpha Waves
Bad Company
Ballistix
Cabal
Defenders of the Earth
Fast Food. Featuring Dizzy.
Flood
Formula 1 Grand Prix (not Microprose)
Hard Drivin'
Hong Kong Phooey
Mean Machine
Outrun. No instructions, you don't need them.
Popeye 2
Robocop
Steg The Slug
The Light Corridor
Whirligig
Yogi Bear & Friends in the 'Greed Monster'

�3 Each
Awesome
Barbarian (Palace). The one with gladiator 'Wolf' on the box.
Barbarian (Psygnosis)
Cap'n Carnage
Captain America. No Box.
Championship Wrestling
Chase HQ II. No Box.
Combo Racer
Daley Thompson's Olympic Challenge. Not STE.
Defender II
Dragon Breed
First Samuri. No Box.
Golden Axe
Harley-Davidson 'The Road to Sturgis'
Hudson Hawk
Impossamole
Mach 3
Menace
Monty Python's Flying Circus. No Box.
Operation Thunderbolt
Oxxonian
Prince of Persia
Risky Woods
Robocop 2
Shadow of the Beast
Speedball 2
Spindizzy Worlds

Spitting Image
Star Breaker (Brand New) Still Shrink wrapped.
Star Wars
Super Hang-On
Switchblade II
Teenage Mutant Hero Turtles
Test Drive
The New Zealand Story
The Simpsons - Bart V's The Space Mutant
The Untouchables
Thunder Blade
Total Recall
Vigilante
Wizkid. No Box.

�4 Each
Ghostbusters II
Lotus III

�5 Each
Street Fighter II

There's a German one somewhere. If you have all the ST Format disks then look through them (that's where a catalogue is handy!!) -- it's in there somewhere!!

I have used Deskpic 5 which seems to work with IMG pics only up to 16 colours.
256 colour IMG pics have their palette mucked up, probably by TOS rearranging
the palette to system nominal values...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Almost all alternative desktops (Gemini, NeoDesk, jinnee, Thing, ...)
allow installing background pictures. With SingleTOS, Thing (and maybe
some of the others as well) even keeps that picture when running a

program (if you do not unload it from memory), so it's only not visible
when programs use their own desktop.

Ciao

Thomas

Hello there,

1)
I'm looking for a keyboard for the Atari Mega ST.
If you have one, tell much how much.

2)
I have a 520ST and was wondering if it is possible to connect
this keyboard (+mouse) to the Mega ST.

Which sort of Mega have you got! Mega ST or Mega STE as they both have different keyboards?

I have a large selection of Atari mags FREE to whoever wants to collect them.[Nottingham, England]. They include ST World, St User(some binders available), ST Format (some binders available) & ST Applications. All are in A1 condition but I no longer have any of the cover disks.
Drop me a line if you require further details.

Has anyone made a MidiMaze type program for the PC? I found one called MazeMan but it's incomplete and the author said they weren't planning to work on it anymore. Since networking PCs is so popular and easy now, it shouldn't be hard to do this. I used to play MidiMaze with my friends, and really miss it. Quake and Unreal and all those type of games are way too fancy for me. I like the simple type of game like MidiMaze.

I have an old (very old) ComputerEyes for an Atari ST-520. I also have a need to digitize some static NTSC video on a different machine.

Does anyone happen to have (or know the whereabouts) of the interface spec (pinouts, signal catalog, etc.) for this beast? It plugged into the ST-520 "option" port on the side of the keyboard.

I know, it's probably easier just to buy a video card for the other machine than it is to rig an adapter and write a driver. But I hate to see working hardware go to waste.

Thanks for any pointers...

Hello there Steve

I've got a APAPII system which some sort of MegaST in it, according to Best Electronics: "They are both interchangeable!"

So, either one will be fine, I'm just looking for a good price.

Thanks!

Is it an STF or an STE ? The STE has a free socket for a maths co-processor.

You don't need a boot disk, if it's anything newer than the oldest 520ST without floppy drives. Other than that, it sounds like a bad mouse or keyboard. Try replacing the mouse. You don't have a joystick connected do you ? Sometimes, the auto-fire on the joystick can cause problems like this.

i*m able to get these 2 atari systems for nearly nothing .

mainly i want to play games (i can get the large software collection
from a friend , a lot of classics included) .

i dont want to buy a standard st cause i want more power to play games , demos , etc . best quality possible .

i*m aloso interested in compatibility questions (can i play old st games on a falcon without probs ?).

system one :

atari tt030 ,orig. Atari 10MB ram extension card plus Mighty-Mic 32 mit 32MB RAM (8x4MB SIMM Modules), 2x 3.5" Floppy 1.44MB, DDD Big-Tower, 1 GB IBM SCSI-Festplatte, SuperNova Grafikkarte up to 16,7 Mio. colors, manuals , books and a lot of software , connectablto to every vga monitor.

system 2 :

Atari St, 4MB, Crazy Dots Grafikkcard, SCSI Harddisk, in 19" Racktower ext. power supply, ext. keyboard, 14" Sony Multiscan Monitor, without cooling device just Studio using.

any help would be great . please respond to : covenant_666@hotmail.com

Hi!

My mate has aquired (don't ask!) an old ST,, one of the ones with a separate power supply in a little box. Only thing is the lack of the mains adaptor! The connector is a 7-pin DIN plug. Can anyone help me with the pinout of this connector? I've tried looking at FAQs and web searching, and have found every connector but that one!

Help!!!

Cheers,

Laz

What is the schematic to build a new MEGA-ST keyboard cable?
I recall that it uses the exact same connector as telephones,
but what is the pinout, at both ends of the cable?

Please Cc your reply via e-mail.
Thanks.

Yes, by DIN 7P pin numbers it goes like:

1	+5v @3A
2	not connected
3	Ground
4	+12v @0.03A
5	-12v (?? probably not used)
6	+5v
7	Ground

The duplicated +5v and Ground are to make sure the current capacity is high enough over the cable and connectors.

I think you can ignore the -12v line.

Check Didier Mequignon's Aniplayer's homepage:
http://perso.wanadoo.fr/didierm/ (also http://aniplay.atari.org)
and look for PICDESK.
I don't know if it really works with NVDI (it has its own accelarating
routines...) but it's a hell of a good program!
If you want (like me) a separate "pic-in-background only" program, ask
Didier if it can be done.
But at the moment he's working hard on his MP3 Player... so please
don't disturb him too much :) !

It uses IMG, XIMG and GIF pictures. There are no problems with NVDI as far as I can see. I use some W95,W98 and Linux KDE backgrounds with it, it has given me no problems thisfar.

Hi all,

I was wondering if there was ever any kits or anything about converting a STFM to 16 meg ? I know the MMU only takes upto 4 meg, but was there ever anything to get around this ?

thanks

Martin,
The Mega ST keyboard uses the so called "Western plug"
which is known as the "telephone plug" but there is a difference in the number of pins used: Mega uses all 6, the phone needs 2 of them although 4 are present. If

you can find the right connectors I see no
problem at all: connect pin1 to pin1, pin2 to pin2...
and so on! For additional info on various kinds of
hardware issues, including "keyboarding" you should try Robert Schaffner's
archives at:
http://www.rhein-main.de/people/robert/index.htm
Visit the site, fill the registration form, download
"DOIT-ST" (1,1MB, I think) and you'll get a key within hours.
Robert did a very nice job!

Nemanja.

Hey all!

Please read quick and see if you can help!

There is an Atari ST running an automated mailer machine, and
the company want to replace it with a PC. I am now trying to get
an emulator to work well under Win95, that allows for communication
via the serial port to the mailer machine.

I have tried WinSTon, TOSBox etc etc but when I use the original
ST disks to boot up in the PC, the second disk causes 3 BOMB
icons to appear on the screen and it hangs.....

So now I dont know what to do! Any suggestions????

Thanks
RN

Yes, look at Mario Becroft's S/VGA adapter. I just bought one and it works great! His web page is at: http://www.ak.planet.gen.nz/~mario/index.html

Hope this helps,
Andy Blakely

I have a 520STFM, motherboard C070789-001 REV D and am curious what chip is supposed to go into U66. Its a 68 pin PLCC (sans socket). Blitter maybe? Considering it has an AJAX installed, it may have been one of the later ones and simply didn't have it installed. Is it just a matter of solering in the socket, pop in the chip and go or do I need to make any other modifications (Note: Socket U201 is empty as well, but I suspect it has more to do with the MC 6850s than the Blitter).

Any help would be appreciated.

Eric

Stick one of Mario Becrofts ST-VGA adapters between them then bask in that monochrome glow :-))...

I do them in the UK, I guess you can find the other guys at Marios website...

http://www.ak.planet.gen.nz/~mario IIRC

I'm surprised that I haven't posted to this group about this.

I need two Ricoh RH5500 SCSI cartirdge drives. For a small SCSI setup, STe and a replacement for the Falcon030.

Just the drives and the manual. I have a ton of the cartirdges already, and enclosures.

I am in the US, Cleveland Ohio.

Regards,

Jim

Hi!

I'm looking for the Falcon MK-X *PHISICAL* especifications: sizes, weight, floppy location (front, side?), keyboard type connection (TT? PC?), colour...

I want to buy a MK-X and put it in a machinery-tower (see, musical equipament furniture) for have all the 'instruments' in an only gorgerous stage.

In the web I have seen prototype/design/bad pics only. And a lot of technical specs, of course!

I'll agree if some happy user can send me the info. Or the scanned manual user, too.

Thanks and kisses! ^o^

Hi guys,

I've had a long time problem with my Atari SCSI chain.

I have an STE, connected to a MiniS SCSI hard drive (Maxtor mechanism) through an ICD Link 2, which works fine. However, when I plug in any other device on the SCSI chain, the MiniS gets garbled (ICD, and an older HD Driver demo both report it's name with garbled characters - data transfer is just as garbled).

For a long time I thought it was my Zip Plus corrupting the chain, but any other SCSI device does this, so it must be a fault in the Maxtor mechanism. I've tried every combination of SCSI termination and tried all the various jumper settings in the drive, to no avail. Any clues?

I want to get this fixed because as the Zip and HD won't work together I have to back up my hard drive to floppies, then from floppies to Zip disks. This involves about 600 disk swaps. It's not exactly ideal..!! (and the whole reason I bought a Zip in the first place was to back up my HD)

Thanks,

Ben Hall,

It's much more likely that your cable is either bad or too long or your
drives are not properly terminated. Remember that the DMA cable
shouldn't be longer than 60 cm.

>shouldn't be longer than 60 cm.

It can't be the DMA cable (that's the one I got with the ICD Link2) as it
works with the HD normally (and yes, it is quite short). It can't be the Zip
cable because that works fine on other computers and the Zip is read by the
Atari/ICD utilities fine, even though it's after the HD in the chain (and
terminated).

After dismantling the HD so often to change jumpers, I've left the internal termination off, and I can connect a passive terminator to the second SCSI port on the HD when I use it on it's own, or if the Zip is connected I can connect the terminator to the second SCSI port on the Zip.

Lastly, I've also tried adding my Yamaha 4416 CDR after the Zip, and that has a hardware termination switch. Once again, even in this configuration, the computer correctly identifies both the Zip 100 and the Yamaha 4416 drive - but once again, the Maxtor data is garbled. So I really don't think it's the leads (although I know SCSI can be funny, sometimes...) or the termination.

Any other ideas?

Lenght of SCSI cables?
Termination ok? Only the last physical device can be terminated.
Older releases of ICD adaptors/drivers are not compatible with
AHDI/HDDriver?

One device, one SCSIID. Maybee atari use ID7, MiniS used ID0, ZIP used
ID5 and so on..

> For a long time I thought it was my Zip Plus corrupting the chain, but any
> other SCSI device does this, so it must be a fault in the Maxtor mechanism.

Without any other device, MiniS use an terminator on the second scsi
plug? If not, the mechanism is internal terminated. (Jumper !)

Remove internal termination, if it�s active, connect your other devices
and use termination on last device.

You chain contains homebrewed SCSI cables? Remove that..
Replace it with quality SCSI wires..

> I want to get this fixed because as the Zip and HD won't work together I

Some ZIP devices needs an active TermPwr on SCSI Bus (Pin 38)
That track contain +5V, supply for terminator packs..

If not, some ZIP devices doasn�t terminate SCSI bus correctly.

TermPwr can be activates on some hard drives. Some mechanism contain
a jumper named "TP" or "TermPwr"

Set it to "ON" delivers +5 to pin 38 on the hole SCSI Bus.
More as one device can have TermPwr "ON". That�s ok.

Regards, Robert

Hi,
Is it possible to connect a 1.44mb SCSI floppy to an STE in the same manner as a hard drive? I'd like to start using high density disks without attempting *another* modification (my first attempt was unsuccessful). I have ICD utilities... would that work for such a task?

Thanks much,
Andy Blakely

On my Falcon 030 I have problems with the keyboard. Some of the keys do not work properly, it is hard to get them issue something. Together with the (left) shift key andor control key it is very hard to get upper case and control case characters respectively.

Does anybody recognise the problem? If so, did you find a solution and if so what was it?

Would hate to have to switch to another computer...

Sounds like a dying mylar to me I'm afraid....YOu can replace it with the keybopard from the STe or STF/FM (I've used these at various times in my Falcon's) or Best Electronics can seell you a mylar if you want..

The simplest thing:

Keys to switch to upper case and/or control characters are broken, some
dirt in the keyboard or one or more tracks on keyboard pcb are broken.

The best and cheapest way is to take another falcon keyboard.
Too many screws, cups and some more in the keyboard.

If not, you have to dismount the hole keyboard.
Check plastic cups below keys first. Check contact points on pcb.
Hard work.

And there are no free programs there. I recently updated my KCS Omega II to the latest, unreleased version for $39. It has some extra features for the open mode - a kind of programming language to extend the possibilities to use the open mode play screen as an "instrument". Plus there is a very useful MPE-module that imports single sequences or tracks from another file, and an unfinished upgrade to the Song Editor that will let you control transposition etc.in lines in real time via MIDI. This version of the Song Editor looks ugly, and there is no text in the dialog boxes. But it can be useful if for instance you want to change drum sounds in realtime.

On a similar note I got my 1040STfm out earlier today and the floppy disk drive has 'died' (making strange sounds and not accessible) Is it possible to find a replacement internal drive? Or would an external drive do the same trick (and if so where could I get one)? - Preferably in the UK.

Thanks...

Hi

There's nothing stopping you from removeing the external drive mechanism and fitting it internally!

Does anyone know if exists any free project to connect a
standard PC keyboard to a Tower Falcon instead of the standard Atari
Mega STE keyboard ? And in the same idea to use a PC mouse ?
And if it is, where i can get any schematics and explanations to build
this one.

I would like to share my PC keybaord beetween the PC and my Rack falcon.

This code does not work under MagiC6, atleast not on my TT... Btw., the wind_get-call should be "wind_get(win, WF_OWNER, &owner, &open, &below, &above)", but this doesn't help much either ;-)

Basically the problem is that while wind_get(0, WF_TOP...) returns the correct handle, the following wind_get-call only returns the same values every time (owner 1, open 0, below 11, above 1...). It also never returns FALSE, so the loop never ends.

I have a lot of small, but annoying problems like this with MagiC, especially the SM_M_MESSAGES to the screenmanager is giving me headaches. They *definitively* don't work as documented!

Hi!

In comp.sys.atari.programmer joska@nuts.edu wrote:
> This code does not work under MagiC6, atleast not on my TT...

Does Thing's topping of already running applications work? I.e., run a non-AV-Client (e.g. Pure C) open some windows in it, switch back to Thing and run the program again. Answer "No" to the question whether you want to run the app again, and it should get topped, including its menu bar.

If that works, the code is OK.

> Btw., the wind_get-call should be "wind_get(win, WF_OWNER, &owner,
> &open, &below, &above)", but this doesn't help much either ;-)

Well, I wrote it from memory, so errors are to be expected ;)

It does in Thing, with MagiC 6.x on the Falcon, as with MagiC Milan (and N.AES, of course). Just a guess: You aren't using Pure C here? It doesn't work correctly for new wind_get/wind_set() opcodes, as it has an internal table telling how many parameters each opcode returns/expects. With new opcodes, the original PCGEMLIB code either crashes or does nonsense. You'll need your own wind_get() implementation, even for WF_TOP of you want to use its extended output.

If you're not using Pure C, I can't tell you what the problem could be.

> I have a lot of small, but annoying problems like this with MagiC,

At least the message to activate an app's menu bar does work correctly, Maus-Window successfully uses it.

Ciao

Thomas

Hello!

On the school where I am working we earlier used STs.
Starting school one autumn after a warm, sunny summmer (yes it is
possible in Norway too!), some keys was almost impossible to use.
I think the problem was due to warm and dry air in the room where
the computers were situated.
The problem was that the contacts on the plastic pads under the
keys did not work.
We did not use the functions keys too much, and I moved the
misfunction contact to the function keyboard.
(It was not so easy to get hold of new ones.)
Perhaps it is the same illness with your keyboard?

This is a new one for me...

I've been using CAF (version 2.06) for quite a while now, but I haven't done any AUDIO recording for a while - at least not since I had the Nemesis installed in my Falcon. Anyway, I was messing around with some guitar/vocal tracks I had recorded a few months ago last night, and for some reason unknown to me, none of the audio mixers do ANYTHING at all!

They've always worked fine before, but not any more. And yes, I've got the correct one chosen in the hardware setup screen, the mixer track is unmuted, and when I double click on it, it brings up the mixer screen (in this example, GRAPHIC EQ). But any changes made to the volume faders or EQ does nothing to the sound. The same thing happens with all of them.

I can only assume that this problem is somehow caused by the Nemesis - perhaps some small error in the installation? But I also had this same problem when I did a clean boot, with Nemesis OFF. And I tried running a couple previous versions of CAF, as well as running from a backup - all with the same results. My mixers just no longer work, period.

Everything else seems to work fine with regard to recording and playback though, and my recently aquired FDI seems to function properly as well (and yes I tested with and without the FDI attached). So is it possible that the portion of the DSP that deals with the effects in CAF has gone bad while the rest is ok? Or have I had some sort of mental lapse and forgotten some setting in CAF?

Any help would be appreciated.

-Paul

That's it :-) I'm using the original GEM-bindings for this project, that's
the problem. Thanks for reminding me ;-)

My problem is that while it will hide an application without problems, it
might (or might not!) show a completely different application even when
I'm using the same apid... Or it will hide the wrong application and
display the correct one. Or get both wrong. Occasionally it will actually
get both right. And yes - I *am* checking the parameters :-/

Hey guys!

Thanks for all the help in regards to the Falcon that I am setting up for my church. This was in setting up the IDE HD. Got one up and running, and the cable was from Best Electronics.

Now, to get some good midi software for it.....

But also, the Atari UG here in the Cleveland area, in conjuunction with a couple other computer groups, is planning a Classic Computer And Gaming Fair, CCAG 2000.

The intended date is June 9 and 10 in 2000. Setup will be on the Friday, 9th, from 4 PM to 10 PM. Saturday will be the fair, from 9 AM to 7PM.

Because it is being held at a National Guard Armory, user groups, individuals, and some vendors, can keep there stuff overnight in the armory, as it will be locked up. Breaking into the armory is a Federal offense!!!!!

Now, the outside motorpool will be for a "flea-market", people doing this can come in at 7 AM to setup out there.

We have a couple of classrooms for vendors, I already have a local Atari video game dealer interested. Note, this is an older armory, and the amps available are limited-unless we want to trip breakers all day!

It looks like Atari, and TI, groups so far. With, Amiga groups being contacted. Timex group here may have a presence.

We have PLENTY of tables and chairs for the inside crowd. And, probable plenty of chairs for the outside.

The Armory is on Route 57 in Lorain Ohio. Right on the corner of a very big park. Can't miss it.

We will be keeping people updated as time goes on. And, a meeting soon of several UG reps will be done to coordinate things.

Now, here is the catch.......

Totally free, both users, vendors, and groups.

Hope to see you guys out there in June '2000!

Regards,

Jim W. Krych

HI,

I have just been given a 520ST. Whe4n you power it on all it displays are two bombs. I have pushed all the chips in and nothing is loose. It is a different floppy drive to the standard one (you can tell by the case mod). It is set up correctly though, although it does keep its light on all the time. I disconnected it, and I am still getting the bombs.

Any help would be gratefully appreciated.

Cheers

Hi

Atari.org are having problems at the present and aren't able to redirect email AND web addresses. So if you send any mail to an address that ends 'atari.org' it may come back.

The web site addresses have the same problem, BUT if you go to www.atari.org and go to the sub-domain list you will be able to get to the site.

While the services are down, why not reply to this thread if you want to
get in touch with someone who has an atari.org email address.

Just a simple message like the following, mine is an example:

steve@atari.org

please drop a line.

your.own@email address here (if different from the header OR it's
another atari.org one)

I little crude but effective!!! but only an idea.

```

>light on all the time. I disconnected it, and I am still getting the
>bombs.

If the disk drive has it's drive motor on continuously, then you may
have the 34-pin Schugart interface connector the WRONG way around.

All ODD pins are grounded so it wouldn't have done any damage. Also if
you get to the Desktop the drive icons may have vanished!

>
>Any help would be gratefully appreciated.

When does the ST bomb out? e.g. as the Desktop appears...

and was there any distortion, lines, flashes etc.. on the screen.

PLEASE NOTE: use steve@steverosie.demon.co.uk while Atari.org is down

```

Hi,

I've recently bought an used TT, this one as 3.05 TOS and a double density drive (and a WD 1772 FDC), I know that I have to change FDC, Floppy drive and dip switch settings to get high density, but which switch controls floppy density ?
What are the other switches for ?
As I want to plug external SCSI devices I'd like to disable TT internal terminators, but despite the fact I was able to find the termination resistors (the two resistors pack near the hard drive fan) I didn't manage to disable them.
How should it be done ? Do I have to unsolder them, or is there a dip switch which controls SCSI termination ?

Thanks in advance, Eddy.

Try carefully loosening the TOS chips. If they are firmly in place now. How you would think they should be. Sometimes this is too good ;) I've found if you get 2 bombs on Boot and the TOS Chips are firmly in place, loosening them often fixes the problems. Atari's official fix for this problem was a 2 inch drop onto a hard surface.

Is maybe a modem configuration problem between you and your ISP.

Try to setup your modem with very simply init string recommended
with Mac or PC.

I had the same problem with my ISP, was data compression problem.

Olivier.

If you grab the file "Don't click Jim's Head", available on most servers you will find in it C source code for playing .AVR sounds, STe support and Falcon030 support are in them. At least to some extent. I updated the code a couple of times after I wrote that, but the basic example is in there.

Sorry about that. It's been a long day at work for me and it's less than half way over :/. Glad you found it. What I had meant was it's available from most of the atari ftp servers.

On mine they just pull out. But, don't fiddle with them until you have the
external bus connected as I have found that I need to leave them in. It's
all a bit "suck-it-and-see" with the TT SCSI bus!

Hi All,

Does anyone have any experience of connecting a SCSI card to a Milan?

I am thinking of getting one to connect my Syquest EZ Flyer and then to get a SCSI flatbed scanner.

There seems to be two SCSI cards available a SCSI2 and a Wide (or it it Fast) one. Are both compatible with the Syquest?

I like the look of the Umax 1200 scanner with Scan X or Scan X Pro does anyone have any recomendations from personal experience?

Thanks,

Peter

Nope :) Thought of that :)

> When does the ST bomb out? e.g. as the Desktop appears...

On power on, you get a little beep and then the 2 bombs.

> and was there any distortion, lines, flashes etc.. on the screen.

As soon as you power on, but very briefly :) I think that is prpbably just Vid chip initialization to be honest. It went a little mental when I took out one of the TOS chips, it came up, the bombs appeared, and then it beeped and the screen looked like a disco :O)

Cheers

Andrew

You can't directly convert one, since they are completely different. A
PC uses a serial connection with the PC, whereas the ST mouse sends
seperate X-Y signals.

You can connect a serial mouse to the ST's serial port if you use the
right driver (available on umich, lip6, etc...). However this will not
work with some games and takes up the serial port which can no longer be
used for a modem.

You can also buy Mario Becroft's adapter, which converts serial mouse
signals to be used on the ST's mouse port.
http://planet.ak.planet.gen.nz/~mario/

This is covered in the Quick FAQ (when it's up again!)

Hi Nick, SJE...

IIRC, you can also go to comp.sys.amiga.marketplace, pick up a used Amiga mouse and convert it. According to articles I've read, its simply a matter of switching 2 wires.

Why not just use an Atari mouse, or one of the better 3rd party aftermarket replacement mice though? ;-)

No way. Jaguar deliver Video with a sync of 15.5Khz
Any VGA display need 30Khz..

Only way is to use a realy old vga display.
Easy way is to use a cheap R,G,B display.

All Video connections (and more) = PROFIJAG HTML

Most third party Amiga rodents have a switch to switch between ST and
Amiga; some also allow selection for a PC rodent!

Other than converting an Amiga mouse as another here has mentioned, you may want to hit up the Aminet hardware/hacks directory for hacks to modify a serial mouse to use on the Amiga. Then switch those two wires and voila! An atari mouse!

You can convert a PC mouse to an Atari but it has to be a BUS MOUSE.It has a round mini din plug with about 8 pins.Cut the end off and solder on the 9 pin dsub connector for the Atari.Compare the wiring from the back of an Atari manual with the schematic for the bus mouse pins (used to be at Logitech's site).I've got a Micro$oft bus mouse hooked up to an Atari...Funny!

Hello,

I have some Atari StE's, and am interested in accquiring a hard drive.
Either proper Atari ones or a nice cheap solution using something else (?).
By cheap, I mean I don't want to spend more than 100UKP at most.

Thanks!

There is a program called Deskpic that does this. It's available on the umich atari archive. Probably on several others as well (it's several years old). It's just a simple AUTO folder program and a desk accessory (I think) that allows you to load XIMG files onto your desktop.

Well, there are *new* modern Multisynch monitors by Electrohome (and another brand whose name eludes me) sold by Software Hut. Yes, they are an Amiga dealer, but since the Amiga AGA machines have/had a lot of the same video characteristics/concerns as the Falcon, these will work with lower (RGB) signals. In fact, I'm using a 17" model right now that lets me do both RGB and (s)VGA on my Falcon on one single monitor. Note that you pay for this privilege, they are rather more expensive.

After that, you would have to find a way to feed the Jags signal to the PC/monitor. I guess you could feed it to one of those fancy cards with TV in. ;-)

Good luck.

I have an off-bard TV-VGA converter that sits between my Falcon and it's 21" monitor (Eclipse 4Mb graphics needs this kinda screen....honest) and it does a nice job of turning it into a TV...it also has ports specifically for connecting videos and games machines to it...It's a Grand TV AMazing if anyone wants to know...

It's a standard RS422-port, the same as you find on Macs. If you want to
use it for e.g. a modem, just get a Mac modem-cable.

There is ways of doing it;)

I do have a program called MACsee:

MacSEE, 'The Macintosh - ST Connection' .... �3
GBP + postage.

As you didn't mention it in your posting, I have no idea where in the
world you are. I am prepared to accept payment in USD's!

Electrically - yes. They're all SCC-ports, but the available baudrates are
different. On the TT (and perhaps the MSTE, I don't know) the LAN-port
shares a SCC-channel with one of the serial-ports (can't remember which)
so you can't use both at the same time.

There is some information about this in the HS-modem archive.

Carl Zittrer wrote in message ...

>Is there any way to get the Atari to read a MAC floppy disk?

Possibly, but it might be easier to get the Mac to use disks the Atari can
use. Newer Macs have the capacity built in to read/write DOS (PC) floppies
which the Atari is quite happy to use. You can get the software for older
Macs - IIRC it's called PC-Exchange.

>Or could I hook up a MIDI interface to the MAC and then ship the MIDI file
>to the Atari throuh a MIDI cable?

Doubtful. You could do it with a null modem serial cable and a comms package
on each machine, I guess.

The TT's serial/LAN-ports are capable of 230k400, few PCs can handle more
than 115k200.

I'm looking for a good home for my Atari SLM804. The printer is complete
and includes the manual, plus the following:
     spare SLM804 carcass for spares
     spare drum unit (�130 value)
     spare toner cartridge (�30 value - still available from SysSol)

All of the above is available FREE to a good cause (school, charity, etc.)
or �50 to the first person to e-mail me!

"Buyer" must collect - Surrey, UK.

Regards,

Ian B

Hi!

To no fault of his, I receieved a 36 pin cable that will NOT work with the
Falcon. I need a Falcon IDE cable for use with the Church's system. I am in
the USA, Cleveland Ohio, and am willing to pay for the cable.

Take care,

Jim

Only the Modem2 baudrates are different. Serial2/LAN are the same.

> On the TT (and perhaps the MSTE, I don't know) the LAN-port
> shares a SCC-channel with one of the serial-ports
> so you can't use both at the same time.

That's Serial2 on the MEGA-STE and TT.

Some recent modems and ISDN adapters can handle 230400 well.
One that comes to mind is the newest Diamond v90 56K modem.

However, unless one upgrades the PCLK of the SCC to 14.xxxx MHz,
baudrates above 57600 are reported to be rather unstable, on the
Falcon especially.

What�s that? Never hear this before.

> the USA, Cleveland Ohio, and am willing to pay for the cable.

Normaly it�s the same 2.5" IDE cable as in notebooks..
Ask Best-Electronics for an falcon ide ribbon.

If you like to add any 3.5" ide, adaptor 2.5"->3.5" is needet.
You can get that normaly by any good computer store.

Regards, Robert

any old notebook cable will do there is nothing special or specific about
falcon IDE cable

Alternately you could buy an IDE-Burster and install a 3.5" hard-drive in
there insrtead ofg the expensaive 2.5" one....Standard single disk in the
standard case model costs only 8 UKP from Abingdon Synthesis Projects (ie

me :-))

I have a Supra Express 56k v.90 modem and I have to say that it definately proves that not all modems are made the same. The thing just flies and works flawlessly on my TT at 230400. A definate recommendation. Hopefully the new owners of Diamond don't screw them up.

Yes the Atari ST could use MFM drives they also could use scsi

if you wanted to use a mfm drive you would need the following:-

atari to scsi converter
scsi to mfm converter

suitable software to partition and format the drives

If any one is interested I probably still have the hardware described above
if I get enough response ill put it up for auction on ebay

Hi people!
I need your help!!!! I have an Atari Mega 1 with an IDE interface. I bought a Conner CFS 270A (270MB, PIO3) HD for it and it the computer itself is aware of the fact that the disk is attached. I can easily partition it, test bad sectors, measure the transfer speed, etc. It all works. BUT, when I copy some files on it and try to start an application
from it it gives me bombs or a TOS Error 35, or hangs. Sometimes it won`t even write the data on the disk and just hangs instead!
However, it will agree to show the text files from desktop!!!, or sometimes to start a very small program (1KB).
"Diamond Edge" says that FAT1 is not matching FAT2, gives "DOS Error -1, opening file, location 1792" messages and cannot do much about it.
I tested the Conner on a PC and it works. Also tried all available HD drivers. Is it possible that the PIO3 mode needs to be disabled somehow?
I am getting sick of the whole thing,
it will make me deeply regret for
sticking to the Atari as my only computer...

Hello!
I am using a Portfolio and have used a standard double-

male printer-cable for connecting to an IBM. I have
made a cable with some changes and a LED for
connecting my STE.
It all works fine and on the first try!
Now I, for once, will ask before I try:
Which one is the right for the Falcon?
Have The Falcon also a parallell port which is
different from the IBM-"standard"?

Did any of your sucessfully run (no crash) Dr. T KCS or OMEGA in a PC
running an emulator? was it possible to access PC's midi outputs?

Thanks, Phil.

I haven tried my parallell port on my falcon very much but i never had no problems with it, using my old panasonic kxp1081 (or something). I really dont think it differs anything from the parallell port in the ST/STE.

regards,
/Fredrik Egeberg aka deez

I'm interested. By "pickup only" do you mean you will only sell to someone who can pick up the computer physically in Australia?

No help, but tell me more about Dr. T emulation on PC. I called the company about six months ago and they were not in business. I also called Emile Tobenfeld's number and left a message but never heard back.

I've got tons of KCS and Copyist files that I would like to transfer to some currently supported environment. At least I'd like to emulate if that's possible. If you know anything about this please respond.

Al.

Thought I read an announcment that all Dr. T Atari software were going
into public domain, and were supposed to be posted on Emile's web site
for download. The downside to all ST emulators is that none to my
knowledge support the MIDI port.

Does anyone know where I can pick up a copy of either notator or Cubase audio
or Emagics Logic audio or Cubase score for my Falcon. I am running
KCS omega II and I can only run it in 600 x 400 mode and Id like to run
my stuff in higher resolutions. If anyone can help me then please
email me or if anyone is selling the software I am interested.
please email me

What part of the world would you like to pick up a sequencer in as I have
several??,Oh if it happens to be America it is too far to bother with
shipping or Posting as I am in the other part

Hi,

The internal floppy on my STf recently broke down. Today I found an external floppy drive that fits into the hard drive port on the back of my ST. Is there any way i can use this external drive rather than spend the money on a brand new internal drive?

thanks,

lincoln

yes, but you won't be able to boot directly from the disk, but if your only using it to write data, it would be "Drive "B" normally.

I'm sure someone could tell us all how to disable the internal drive
and make it work like the Orginial 520ST's which used both drives (A &
B) as externals' only.

Mike

But also because STOS and other programs for antique computers will one day be collector's items. And maybe sooner than you think. Obviously the programs themselves can be easily replicated and won't have much monetary value. But original disks with the labels intact, manuals and boxes will escalate in value as they become scarcer.

If it plugs into the external disk drive port. I'm not sure about it using the hard drive port!!!

You can use most 720K disk drives, although a little cutting of the case may be required!

I have a 1040 STe with the SM124 monochrome monitor and a Falcon with PTC 1426 color monitor. Untill now I used a TV if I wanted to see some colors

with my STe but the TV died lately.
Here's my question: can I use the PTC 1426 monitor with my STe, if I can,
please tell me how.

Thanks.

Hello!

I have used Portlink2.prg and a spesial cable on an STE to transfer data
throug the paralell port to and from a Portfolio.
It worked perfectly the first time I tried it!
But it is impossible to do get it working on my Falcon 030.
It can read the names of the files (FAT) on the Portfolio, but is not
able to receive or send any files through the paralell port.
(Message: Portfolio is not responding.)
I have been using Magic 5.13 on both computers.
Can anyone tell med why it do not work?

UK> AES documentation?

Oh yes, it is in my Lattice manual, I supposed it was a "new" AES function and only searched my docs on files, sorry, it is clear and working now, thanks a lot !

What I need now is to find the way to detect what applications are running and top/hide/unhide any of them, I think this should be in the MagiC documentation. I know there is appl_find to get the ap_id of a given appl, but I think there should be something to find running appls, something like appl_search I think. The other problem is more difficult, I would like to detect windows opened in the system, give a running MagiC system, I would like to search for all opened windows with their state (hidden, iconized, fulled...) and the owner application..... possible ?

This sound new to me, the .tos program isn't run by vt52 anyway ? I would
like to avoid this. I also found around some gem libraries, "gemlib" seems an
update one, are those things worth and are they free ? They seem to simplify
the effort detecting wich OS (TOS, MagiC, N.AES..) and using appropriate
functions for non-modal dialogs and so on.

I have an atari 520 STM with 1 MB internal and 30 MB harddisk that is doing
nothing at the moment.

Is there software available to run Unix or a Unix like OS (minix?)
available to run on this configuration?
If yes, where can I get it?

Thanks,

Paul

I tried this as well maybe 2 years ago and I could never get it to work either.
I reported this to Andreas but I don't think I ever got a reply. I guess
it's just not working as it should. Maybe it has been fixed in later versions
of MagiC?

> Also, is there an easy way to top (bring to front) an application under

Wasn't this a "bug" in some versions of MagiC? Which version do you use?

> state (hidden, iconized, fulled...) and the owner application.....

> possible ?

Yes, at least the list of open windows is easy to get:
wind_get(WF_OWNER) will give you the application id of the owner, and
the window-id of the window below and above the window in question.

So, basically do this:

```
wind_get(0, WF_TOP, &win);
while (win)
{
     if (wind_get(win, WF_OWNER, &owner, &below, &above))
     {
          /* Do something with window win and the owner id */
          win = below;
     }
     else
          break;
}
```

Note that WF_OWNER isn't available on older versions of GEM (but MagiC
has it, as well as MultiTOS, Geneva, N.AES, ...), so it's best to use
appl_getinfo() to check for its existance.

HTH

Ciao

Thomas

You'll need Nemesis (or Centurbo) or a similar accelerator to get the
higher resolutions or else get one of the wonderful new Eclipse graphics
cards and wonder how you survived without rock-solid 1280x1024 displays on
a 21" screen....like me :-))

fx <Evil laugh>...

when they get the 1600x1200 mode working I'll be looking for a bigger
monitor...anyone interested in a 21" Dell ultrascan :-))

Try booting the machine with no disks in and then once at the
desktop, format a floppy, write the desktop.inf to it with save
preferences and then try to open an icon and read that with S. P. C.

Let me know if that works.

There were Unix-like OS available for plan 1040ST back in the 80's.
They are however, not able to run today's software and are very rare.
Minix is not available anymore, but the file system is quite popular on
MiNT. I guess if you expand the memory to 4 MB you would be able to run

a UNIX-like environment with MiNT.

Greetings,
Matthias.

I have a couple of extra. Send me your address. These are for 2.5" to
2.5" IDE drives, not 2.5" to 3.5".

>Secondly, where can I get the schematics of the composite adaptor for ST's

The users manual has the pinout. The other good source would be the
DoitF030 package from Robert Schaffner. Also you might want to look at
Hallavart's launch pad. There are several links there with the info.

One of the few female users and you chase her off with stuff about
installing a graphics card in an STFM. My God man, what were you
thinking? :)

Try to get the cable from a local notebook dealer. (apple store)
It�s a "normal" flat for notebook drives.

Otherway: call best electronics (Mr. Koda)

> Secondly, where can I get the schematics of the composite adaptor for ST's
> that have the composite video out?

Witch kind of adaptor u mean? Internal? External?
Cableadaptor? External R,G,B to FBAS (Composit) convertor?

-> DOIT_ST, but it�s mostly in german..

(Schematics are multilingual) :>

I have the following for sale:
1. Atari ST 520 Keyboard (has 1 meg ram upgrade)   No power supply I lost it.
2. SC 1224 Colored Monitor
3. Two SF 354 Floppies w/ power supply
4. I have the manuals and some assorted programs like:
VIP Professional Business program
Superbase Professional
Habla Writer
Wishbringer
Degas (art program)
80 diskettes of assorted Shareware programs and backups
A few assorted Atari Books

The 1st reasonable offer gets it all.

Thanks
Mike Jackson
On Ebay my name is Kingnick and I have a excellet rating of a 64 basiclly meaning I"m good to do business with.   All of this stuff worked the last time I hooked it all up. I"m selling it as is. And I offer a full refund if you not happy with it after 7 days. Please make best offer.

Hmm, well the question included the words "hardware" and "ST". I have
experience of that but not software.

```

I'm having problems with using the SMC_* -messages under MagiC6 here. I'm
trying to hide and show applications, but MagiC does not behave as
documented in the the english MagiC-docs...

E.g. I send the following message to the screen-manager (APID 1):

```
msg[0] = SM_M_SPECIAL;
msg[1] = apid;
msg[2] = 0;
msg[3] = 0;
msg[4] = 'MA';
msg[5] = 'GX';
msg[6] = SMC_HIDEACT;
msg[7] = 0;
```

Sometimes this will actually hide the correct application (apid), but
other times the *exact* same message will hide another app, or even crash
an (apparently) random application... Does anybody know what's going on?

Also, is there an easy way to top (bring to front) an application under MagiC? The only thing I've found so far is wind_set(-1, WF_TOP, apid), but this one doesn't do what I need (actually it flash the menubar of apid for a brief moment and then switch to the desktop). I guess I could top the apps' windows.

I now remember why I didn't make Taskbar MagiC-compatibel in the first place :-(

Yes MFM drives work on the Atari ST. You need the following

ICD Host adaptor
Adaptec 4000 or 4070

The Adaptec 4000 has input of SCSI and out put of MFM

It's been awhile but I've got out my atari 800. I can't remember what to

do. I have a problem when I put a disk in the 810 disk drive nothing
happens the screen just stays on atari memo pad. I can't remember if I
have to have a cartgrige in the comp. to play a game. the only cartrige
i have is atari word and when I put it in a get a list of options, I try

pressing the load option of the index of files to try and see if it will

get my game from the disk drive but it always says device not ready. I
wonder if the parallell cord is bad between my comp. and disk drive.
There are two places to plug this cord in on the disk drive. I believe
I've tried both ones and still same results. Well that should give you
the just of what's going on. Any ideas out there?

Yo!, Dudes!!.

Are there any Magic 6.1 users in here who also use ALICE,
(ALl IConify) doohickie).

Since upgrading to version 6 Magic (6.01 and now 6.1) Alice has
caused problems.

What happens is that the window resource extension fails, i get the
iconification features but lose my nice new window colour scheme.

Has anyone else suffered this problem?.

Laters Dudes!.

Regards from STEve & his nice warm cosey PAK'd MegaSTE.

I have just acquired a 520stfm, and when I try to access either the internal
or external floppy drive, I am informed that the drive is not present or has
no disk in (even when it has) or that the drive is not connected properly.
After ensuring all the above are taken care of the drives still refuse to
read. Could this be a problem with the I/O circuitry?. If anyone has any
suggestions please reply

Hi

Have you double checked that the main connector is the right way around.

If it's fitted wrong the drive motor should be on and the computer will
not be ale to see it.

Double check the power plug and socket with a meter to check for power.

Do you get the drive 'A' & 'B' icons on the desktop?

Thanks for the speedy reply.

I have checked the polarity of the main connector, and it is the correct way round and reads 12v

and yes both drive icons appear on the desktop

once again thanks for the response.

Steve

Thanks for the speedy response.
Yes the mains connector is the right way round, I also checked the polarity
which is o/k and the voltage reads 12v,  and yes both disk icons do appear
on the desktop.
Is it possible that both drives died at the same time ?

once again thanks for the response.

Steve.

If the drives die B-I-G, or if you have NO drives connected you don't
usually get the drive icons!!
```

Have you got another machine to try the drive in?

```

Hi,
I want to buy Cab 3.0 , the superfast version of the only neat
browser for Atari. It only has to be programmed by alexander Clauss
I cannot imagine i'm the only one who wants it, so come on guys,
let's give alex a signal that we want his update for atari and not
for that ugly Imac, a computer which is bound to drop of the store
shelves within a few months......
So let's visit his homepage and send him an email.
his homepage can be found on http://www.tu-darmstadt.de/~aclauss/
If we all react, he cannot ignore our wish and of course we want to
pay for it, cause good work has to be paid.
So react in this newsgroup and to Alexander in person.
Let's hope he'll do it !
Jos

This is most likely a 360k single-sided drive. Are the disks you're using
that format, otherwise you will have errors reading other types of disks (eg
720k or 1440k)?

If the Imac dropped off the store shelves tomorrow, the installed Mac
userbase would dwarf the Atari. And it's not like Ataris are going
to replace them on those shelves. I'd love v3.0 as much as the next
guy, but I imagine Clauss has bills like the rest of us.

The new version is a better one than V5.4 :-)

At last I put in the few special 040 & 060 instructions.

  new since 5.3:   (Forget V5.4 That one was a bit premature :-)
        Marking of jumptables for label generating.
            Find jmp's and jsr's with indirect operand.
        Give names to absolute word addresses.

```
        Options in the config file related to the above.
        Give names to standard labels.
        Attach a short comment to an address.
        More flexible index file.
        At last!    Full 68040 & 68060 support.

Visit my web site:

Good point, I forgot completely about some STFM's have a single sided
beasts in them!!!! (administers as severe slap across the face;))

Yes, and that has been the main issue all along:    Alexander is
making a small fortune on iCAB, while CAB 2.* was mostly spready
through piracy (e.g. Vectronix, etc.) and few people purchased.

Otherwise, the iMAC is gaining a _lot_ of supporters (myself
included) and is starting to threaten Windooze for people who
prefer to pay a bit more to get a well-designed, well-integrated
and user-friendly machine, which the iMAC definitely is.

Can anyone help!

My stacys screen backlight has gone very dim and there is a high pitched
noise coming from within the unit.
I'm an electronics engineer so any info which would save me getting the
scope out would be very much appreciated.

I'm also looking for a multi midi port expander for my STE. Any suggestions
which one to go for and why would also be useful.

Thanks,
Richard B.

The STacy's backlight *will* go dim eventually (the EL-sheet "wears out"),
but if this happened suddenly...

> noise coming from within the unit.

...and this noise appeared at the same time it's most likely the internal
PSU that's dead.

I'm sorry, I don't know anything about it. I just got a replacement for
mine ;-)

Thanks for the info Ross,
 the disks that I have been using are 720k DSDD , and if as you say the STFM
uses 360k disks, this could be the source of my problem, I,ll check it out
when I get back home.

Thanks Steve

I still haven't sold this stuff.. and I noticed a few people are asking about some of this gear, so I am willing to part this stuff out. See the urls below for more info if you're interested. Reserve is very fair, but if reserve is not met I may still sell to high bidder.

-Steinberg (SoundPool) FDI, Falcon Digital Interface.. this one has been upgraded to greater then 16 bit capability.
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=138493756

-SoundPool ADAT interface.. allows transferring audio to/from ADAT to Falcon.
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=138498464

-Steinberg ST-MIDI 3.. adds 3 MIDI outputs and 1 MIDI input to Falcon.. useable only with MROS programs (like Cubase Audio Falcon)... $100
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=138503090

-Cubase Audio Falcon.. with dongle, CAC (clock), manuals, etc.. I also have the Studio Module, Cue Trax, Style Trax package that I found invaluable..
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=138507447

I will also sell the entire package above for a good package price if you're interested..

I will have a 14 meg Falcon for sale, with Screenblaster II, NVDI 3, HDDRiver 5, VGA adapter, tos 4.04, Diamond Edge/Back, etc when I get my jaz drives cleared and copied to my Mac.. make offer if you're interested.

On Tue, 27 Jul 1999 at 18:12:15 a message from was created on the
subject of 520 stfm dodgy disk drives.

>I have just acquired a 520stfm, and when I try to access either the internal
>or external floppy drive, I am informed that the drive is not present or has
>no disk in (even when it has) or that the drive is not connected properly.
>After ensuring all the above are taken care of the drives still refuse to
>read. Could this be a problem with the I/O circuitry?. If anyone has any
>suggestions please reply
>
>steven.hillman@tesco.net
>

Were the errors just from trying to read/write previously known good disks or formatting new ones? If the disks are known to be valid, then the drive heads may be out of alignment (or the heads on the drive that wrote the disks originally are misaligned) and the drive cannot find the FAT.

Alternatively the drive sensors may be shot (unlikely, but possible).

The internal and external drives can be replaced with PC 720/1440k floppy drives. Check out the Quick FAQ for directions to where to get the info and other oh-so-useful bits and pieces.

'Aleikum

Eric

So are my prices too high? Only 1 bid on 1 of the items so far..

Do you think I'm asking too much?

That's the beauty of the E-bay... you can put something up there for what you think it's worth, and if someone bids for it, you get the money. If not, you keep the item!

The fact that one person has bid for one of the items shows you have probably hit a good price range. At least what they were willing to pay.

And of course, there are always those that wait till the last minute to bid on items to keep from engauging in a price war with another bidder. (not that I personally know anyone that does that... hehehe....)

Doctor Clu

I have a 4 meg STE and a pc. I have a laplink cable with 1 9 pin connector and 1 25 pin connector on each end. Is this a null modem cable or not. I can't transfer any files at all either way. I have also tried on my Amiga.

Any help greatly appreciated.

If it's a laplink cable it will be "null modem".

What software are you running? For the Atari the best is probably Ghostlink
which gives you a disc icon for the PC HD on your Atari so that file
operations are easy using drag-and-drop.

In theory all you need are terminal responders at each end but Ghostlink
make things so much more straightforward. It comes with the Atari .PRG and
an .EXE slave to stick on the PC.

Any ideas on how I could download a MIDI file on my MAC 2ci and then play
them on my Atari ST sequencer?

Is there any way to get the Atari to read a MAC floppy disk?

Or could I hook up a MIDI interface to the MAC and then ship the MIDI file
to the Atari throuh a MIDI cable?

I'm new at this, so I would grateful for any help.

Thanks for the info. I have managed to get it to transfer files each way but
vey slowly.  I am using vanterm 3.8 from  an st format cover disk. I have
tried to download ghostlink but can't find it anywhere. I have seen 4 links
to the file but each is not available.

Is anyone familiar enough with the Stacy to confirm wether a high-
density floppy can be fitted in?  I already have TOS 2.06 installed,
so that part is covered.  What else beyond that, short of changing
the controler to an Ajax chip?

> another disc drive.

Well, to plug in a B drive, you will need the cord, psu, case, etc... therefore I was assuming you already had an extra external unit that you wanted to convert. Building it up from scratch would be difficult. The upgrade from a 720K drive to 1.44M one is described in section 3.3.2 "Upgrading to a HD drive":
http://quickfaq.atari.org/stfaq_3.htm#32

You will have to perform exactly the same changes to an external drive as you would to the internal drive, and you also need to follow the instructions for hacking the ST's controller chip to provide it with the 16MHz signal. This is all described in several text files including Hallvard Tangeraas' one at:
http://launchpad.atari.org

Yes, but the cinch input is for a composite signal. With no RF modulator fitted, the ST has no composite output. Therefore, the only way is to get an RGB>composite adapter. You can find these in some electronics/TV shops. A radio shack should have things like that.

> > It sounds like you are only getting a black and white signal.
>   I am not getting anything yet, because I didnt make a cable. I dont know

>   how to connect it. I know what to do with audio, but video is my problem.

>   someone could point me to some technical link about television signals.

On your ST, pin 2 (composite) is not connected. The ST only has RGB out.
Your TV only has composite in. See above.

It can be done, but it would be easier to buy an adaptor off the shelf.
Note that you will get a slightly blurrier image from mixing the
signals. This is why you get a much nicer image from a proper colour RGB
monitor like the SC1224. Note that the adapter might cost as much as a
used SC1224, but it might be easier to find.

Mario Becroft is selling one. He has distributors all over the world:
http://planet.ak.planet.gen.nz/~mario/hardware/mouse.html

Sorry, but that's an electronics problem. Check it with a TV repair shop
(bring the ST with you so that they can test the monitor with some sort
of signal).

M.Grove wrote:

Hi Mike,

> That's just what I ment. The date for the Eclipse and
> Tempest keeps slipping, just like the deliverly of the
> A/B's.

You can't compare it with the AB's. That was an entirely different story and it was controlled from germany in the end. I don't know what release date there has been on the Eclipse but it's not that much delayed. I think it's just a a week ot two at most which isn't bad at all. But I could be wrong. What was the date which is slipping?

> I would be interested in hearing from the tenth person to
> sucessfully purchase one (beta testers excluded) and report
> back on software compatibility, installation, and various
> Falcon motherboard compatibility issues with REV G/H and K
> machines. How does Apex Media run under PPC emulation? How
> does Cubase Audio run under PPC emulation? If those two
> applications don't work, why not just purchase a Milan?

So you are talking about the Tempest now? I believe that there hasn't even even been set a release date for that one. It's rather hard to answer your question as it's still in the development phase. Regarding to hardware compatiblity with different revisons of the motherboard it shouldn't be as troublesome as many other accelerators as the Tempest doesn't push the hardware to its limits as some other does. But the future will tell.

> Sorry, but a PPC running 68K emulation at the speeds advertised just doesn't turn me on for the price they want.

Ehh...?? If you get 2-10 times the speed of the CT2 depending on the application at the same price as the CT2, you would think it was bad? Even if it was faster than your AB?

> An Amiga PPC card can be had for 1/2 the price (god knows why you would want to do that either:0).

Ehhh... which one? The boards I have seen cost as much as the Tempest and up to more than twice as much. Could you give an example before saying something like this?

> Hey, i'm a hard core Falcon user, but the "BIG" hype of networking cards isn't all that big of deal for us "older" users that don't have our accounts at school where a T-1 is available, and in the U.S., anyway, homes, apartments and motels don't have that kind of access either.

So the possibility to have it is of no interest? I don't know how it is in the states, but here in sweden more an more people get access the internet through cabletv networks etc. If you don't want it you don't have to buy it. It is as simple as that.

> My NOVA is fast enough. My A/B 060 will be fast enough. I expect no retoric from one who thinks an A/B without a Nemesis is fast enough.

Have you got your 060 working yet BTW? Also the Eclipse is not target at those who already has a AB or Nova but those who doesn't and they are many many more than those who has. If you already have a Nova there is no reason to change.

> And you, dogging on another user (R.A.)in the newsgroup for talking about software he is beta testing that isn't available to anyone else. Shame on you, you Apex Alpha and Core Design advocate....

Ehhh... I just thought that I would point out that beta testing is usually done through private mail and fVDI is available to everyone who wants to try it. Its free for you to download and I know for sure that Johan wants people to try it and tell him about the problems just like R.A. did. It's just that it's not of much interest to most of us and he has a habit to write very long, but interesting, messages. I don't

want to get into a argument about it as it was meet as hint
to him. Maybe I put it in the wrong way and I'm sorry if I did.

I'm no advocate of Apex Alpha or Core, I'm just interested in
what is best for me and if I believe in a product I will ofcourse
talk in favour for it.

> Where is Apex Alpha by the way? If there were beta versions
> that actually worked, and the project is discontinued, why
> not just release the betas into PD? It would go a long way
> to smooth over the bad rep that Titan has gotten over the
> "lost" Apex Media disk that so many users have complained
> about......

Why are you saying this to me?????? I have no interest in Apex
and I never had. I just beta tested it while it were still being
developed that's all. I have no relations to Core except that I
try to help out where I can in opposite to some other people
who just moans.

Did you have a bad day Mike?

What third party Atari hardware release date hasn't slipped?
I seem to recall things being years late or never showing up at all...

>I would be interested in hearing from the tenth person to
>sucessfully purchase one (beta testers excluded) and report
>back on software compatibility, installation, and various

Of course. The Tempest obviously isn't going to make the
'2nd Quarter 1999' expected release, though.

>machines. How does Apex Media run under PPC emulation? How
>does Cubase Audio run under PPC emulation? If those two
>applications don't work, why not just purchase a Milan?

Well, if a program doesn't work under emulation for some reason,
you can always run it on the '030.
The Milan is a lot more expensive than the Tempest is expected to be.

>Sorry, but a PPC running 68K emulation at the speeds
>advertised just doesn't turn me on for the price they want.
>An Amiga PPC card can be had for 1/2 the price (god knows

You can get a PPC accelerator for #100? (# = pound sign)
Where?!?

>My NOVA is fast enough. My A/B 060 will be fast enough. I

Your NOVA would be even faster with fVDI. ;-)
(There is currently no suitable version of the mach64 driver
 available, unfortunately, but there will be once I get the time.)

I hope you get that '060 working well soon.

>And you, dogging on another user (R.A.)in the newsgroup for
>talking about software he is beta testing that isn't
>available to anyone else. Shame on you, you Apex Alpha and

Nearly all fVDI beta versions have been publically available.
Ronald just fetched it from my ftp site.

Thanks to virus CIH and nato bombing I get one idea: putting Flash EPROM-s in Atari ST(E) machines instead usual (E)PROMS. This will allow very easy and fast modification of BIOS , TOS and GEM - really good thing for TOS patchers (Philip Taylor where are you ?) . If there will be some interest, I will make project, which should be quite simple btw.

It's a GOOD idea.

Most of the modern Flash devices have faster access times than old TOS ROM's, how about making the Flash read cycle a big quicker.

Maybe even access the Flash @ 16 MHz by switching the ST's CPU clock when it is accessing the the Flash area. That should get you a nice speed increase.

It's easy to do, especially if you use one small GAL to do the CPU clock switch/Flash decode-access thing.

Only a few wires to solder & not too expensive either.

//MK

No, I just don't have much interest in this project, and tire of hearing about how great it is. Centek has taken a lot of shit, and not many stand up for them. I don't even

know the company, but they have replied to my mails in a
timely maner, and produced what they said they would, in the
time they set. It is a quality, hi-tech product and
they should be commeneded for what they did for the Atari
world. What other company besides the Milan crew has as much
information readily available on their web site as them?
There, they give you the software and updates and tell you
what to expect. No bull shit as far as I can tell.
Hell, they even warranty the product. Best of all, they gave
highly technical updates during the project. These are
important to me. They openly discussed problems they had
before the product went to production. I have only seen
speculation on the PPC product. Aside from the normal hype,
I don't think I have seen any really interesting technical
details published.

So, with knowledge, fears can be subsided.

Nothing personal Magnus, your just on the otherside of the
keyboard;). Maybe I have been in the group to long..

Mike

JK
What third party Atari hardware release date hasn't slipped? I seem to recall things being years late or never showing up at all...
MG
:) Got me there. I just had money riding on the last ordeal:).
JK
The Milan is a lot more expensive than the Tempest is expected to be.
MG
I was guesstamating about $1100.00 for the video and accelerator? Am I far off?
JK
Your NOVA would be even faster with fVDI. ;-) (There is currently no suitable version of the mach64 driver

available, unfortunately, but there will be once I get the time.)

I hope you get that '060 working well soon.
MG
fVDI looks promising for the NOVA. The later versions of NVDI seem to be geared towards
MagiC than NAES and MiNT.

The 060 works. I toasted a trace on the A/B that had to be repaired. That inturn blew
a few caps on the socket adapter. That has taken a while to fix as I have to do it
at work under a microscope. The problem I had was with the MI signal the 040 produces.
The Mach chip on the A/B utilizes it for bus timing of some sort. A bad mistake. But
before I burned the trace, I had been able to three state some signals and simulate
the MI for the AB when the 060 is installed. The 060 then initialized on the diagnostic
cart without addressing errors that were occuring. Unfortunately, TOS will not allow
it to boot from ROM. I have an EPROM, and am waiting for Petr to release his new TOS.
Plus it is summer. It is to easily to put off soldering work

in 112 degree weather in
in the desert.

Mike

...
>Wow, you mean they are going to sell both the Tempest and
>Eclipse with a video card and ram for $500.00 US?

The prices quoted for the Eclipse and Tempest are both GBP199
(I don't know the exchange rates, so I'm not going to try to convert
 that into US currency.)

The Eclipse is just about to be delivered, so that price is unlikely
to change. The price on the Tempest might of course be higher once
it arrives, but probably not by a huge amount.

>Now that is a deal:).

It certainly is.

Speaking of hardware and prices, I read in the June issue of ST-Computer
that there's now a RagePro/8Mbyte PCI graphics card available with
drivers for the Hades, at DM499.
According to pricewatch such a card can be had for USD42, and the
fVDI mach64 device driver should work with some minor tweaks...

You can also check out Vezzelli's Atari hardware page. Don't know the
address, but it's linked on other sites. There are lots of descriptions on
various conversions. My own DD-HD switcher among others.

> >>   2. How to get a proper signal from Atari video output to connect to

What you're asking about is simply impossible.

Your german Atari, without modulator, has no way of showing a color picture
on that TV. You can (I believe) get a black and white picture in ST-Lo and
ST-Medium. Maybe it is possible to use an Amiga external RF modulator, but
I'm not sure about this.

Suggestion: Get another TV set (with SCART and thus RGB in) or get another
RGB monitor. Philips, Commodore, Amiga, and Atari monitors will do nicely.
There is also a remote possibility of adding circuitry to an EGA monitor and
thus get a viewable color output from the ST. The Dutch magazine Elector
Electronics had a description of that many years ago.

For ST-Hi you can use most SVGA monitors, with a special adaptor cable.
If you find a NEC3D you might be able to use all three resolutions on it.
The same goes for other monitors within the TV frequency range. The VS is
50Hz (Atari can output 60Hz as well) and the horizontal sync is... someone?
Around 15KHz.

> >>   3. How to repair the keys that would not to work anymore?

Depends on what's happened to them?

> >>   4. Why my monitor often beeps(about 10kHz) when I turn him on?

What you hear is the swan song of your monitor, it's about to die.
Don't use it but instead take it to a TV repairman.

If you're lucky it's just a bad solder joint...

David Encill informs me today that Doug Little still fully intends
to bring APEX Alpha to market. He says that Doug is just very busy
with a number of other projects currently. I'm hoping he's right.

What is story behind APEX media and lost disks? I emailed David to
ask if he can upgrade my very early (v2.0) version of APEX media,
and he says no problem...just send #12.50 and the original disks.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Maybe you should check the facts before you spit fire the
next time? ;-)

The Eclipse is a bargin (the Nova was to with the deal I got,
but the original price for the Nova was way to high) and the
Tempest is just about right as well compared to what you
get for the Amiga.

So why do you care? It hasn't been very much talk about it in this group which kind of suprise me. The Amiga fans have been raving about their PPC accelerators for well over a year now.

> world. What other company besides the Milan crew has as much
> information readily available on their web site as them?

I would think the information will be there when the time is ready. BTW. Have you even took the time to look at the pages about the Tempest lately? There is already _alot_ of info in there and a FAQ. The Milan pages doesn't realy say much if you care to read through them

> There, they give you the software and updates and tell you
> what to expect. No bull shit as far as I can tell.

Kind of hard to give you updates of a product which isn't even released yet. Even then, you can already download beta versions of fVDI to try your self. Not to bad eh?

> Hell, they even warranty the product. Best of all, they gave
> highly technical updates during the project. These are

I don't get it. Have you checked out the Tempest pages or not? If there is anything you want to know, why don't you ask?

> Nothing personal Magnus, your just on the otherside of the

> keyboard;). Maybe I have been in the group to long..

I know. See ya.

-ROTFL-

Exactly the same answer as last three years..
(Sorry)
Need�s a new disc, old one is scratched :->

> What is story behind APEX media and lost disks? I emailed David to
> ask if he can upgrade my very early (v2.0) version of APEX media,
> and he says no problem...just send #12.50 and the original disks.

And wait 3-8 month.. (He forgot add that..)
(Sorry..) My own update storys, not only one time, teach me these words..

No privat war with david/titan, but the service is -bad-

Service was good, allways, but only in the first year
i used apex. First update needs ONE week. Later updates month..

Regards, Robert

Not directly related to this, but... I was wondering would it be possible to put add-ons like NVDI or even MiNT into ROM? On machines with the 4MB RAM limit that would free quite a lot of memory for applications, and even might make the ST-type machines run a litle faster, if the hack is made to accelerate the CPU and access the ROM at 16MHz.

And another thought, concerning TOS patches:

* Many people use NVDI- that replaces the VDI of TOS;
* One can use N-AES or AES4.1 to replace the AES of TOS;
* Alternative desktops replace the limited desktop of TOS;
* HSMODEM patch replaces communication routines of TOS;
* MiNT replaces some other TOS routines;

So, what is left of the poor original TOS? Not much. And would it be too difficult to put together these main patches, relocate whatever should be relocated, delete the old routines from TOS, and create a decent OS that might be burned into EPROMs.

It would not hurt anyone's copyright, if a patch program be created, so that one can create a new OS image for his personal use, using his own copies of NVDI, TOS, etc.

Cu.

I like the idea very much. It is nice that you are willing to design that.

But didn't someone ask a similar question in this group, a while back?
I think he got a number of Flash EPROMS and asked if they could be used,
and it turned out that there would be some complications?

Btw. would the GLUE chip permit an attempt to write into the ROM address
interval?

To previous your post:
Of course that Glue will not allow write to ROM, but it can be solved with simple trick.

>
> Not directly related to this, but... I was wondering would it be possible to put add-ons like NVDI or even MiNT into ROM? On machines with the 4MB RAM limit that would free quite a lot of memory for applications, and even might make the ST-type machines run a litle faster, if the hack is made to accelerate the CPU and access the ROM at 16MHz.

ROM space is limited to 256KB, so I don't think that it will be possible without complicated hardware modifications. Other thing is required modification of software, to make it run from ROM.
I don't have such ambitions. I just want making simple and quick project.

Well, Atari users, let start work on it ! :-)

I just want remind that nobody in UK made UK (or US) TOS 2.06 able to work from RAM, for long years. I made it in less than one day work - practically all it was finding of addresses to not relocate. I used printer and some simple routines to make search of specific instructions faster.
Prog. is at : http://members.tripod.com/~piters/atari/tosload.htm .

What about KaosTOS and SuperTOS? It can and has been done- perhaps a
R/W rom image that is loaded as the OS, accepts the patches as applied,
then is captured back to disk- using the RAM relocation vector address
as the starting point in TOS2disk. Within limits this may be a solution
to apply the more modern patches to the OS.

Ethernet Open Discussion Project

Seeing the lack of ethernet connectivity as a major drawback in using the Atari M68K machines and in view of the stalled SCSI-->Ethernet project, I'd like to propose a discussion on an ethernet solution based on massproduced ISA cards.

Karl Samyn has told me that there are people who can write the software drivers, which to me seems the biggest job. This discussion will be focused on hardware matters.

Anyone can join in and propose, criticize or correct in the discussion.

What's it good for?
Lots of things. One minimal requirement is that you have access to at least two computers, a solo network is a contradiction in terms...
A network means that you can share resources like printers, harddisks, modems, etc. Say that your family is all computerized. A PC is used by the kids to play games on. You're using your Atari for music production and your wife has another Atari for writing her novel. With a network all of you would have access to the PC:s harddisks, which means that harddisks for the ST:s wouldn't be necessary. Also the weird windows-only printer connected to the PC can now be used by both Ataris as well. All the family can surf the net at the same time, each on his/her own computer.

There are many more uses. An extreme computing project on the Linux platform is the Beowulf system. Beowulf networks a number of (differently equipped) computers into one "organism", to perform distributed computing tasks.

One such task could be to compute graphical manipulations to happen in realtime. A virtual picture is defined, say 1.000.000 pixels horizontally and 600.000 vertically. Say that the color depth is 32 bits and you get L-O-T-S of pixels to work with... Say that the computing time for one transition is 6 monts with one machine. With 6 machines it would be 1 month. With 60 machines it would be 3 days, etc etc.

(For anal types who'd want to remark that there are losses due to overhead, yes you're right. But I'm just trying to draw a picture here...)

Here are some starting points to begin with.

*Is there already a solution for the Amiga or Macintosh computers that could be easily adapted to the Atari hardware?

*Where to interface the ISA card? On the processor bus, on the cartridge port, on the DMA port? I vote for the processor bus, but all suggestions are welcome.

*Which well-documented card (chip) to choose in the first place?
It is best to concentrate all efforts to one single type of card in the beginning. Later new drivers can be developed for other manufacturers.

*Ideally this solution would work on all the processors and bus speeds used by the various Atari models and their accellerator cards. Also this is supposed to be an unrestrained solution, that would give the same possibilities as on a PC. No stupid "parity disabled SCSI interface" or "almost SCSI, but not really, we call it ACSI", or "we delivered the printer port from one signal that the rest of the world has included". In other words no Tramiel cheapness!

*The information from this discussion is free and available to all, and so is the right/grant to use it for projects/products. If you're industrious and want to make a buck from producing cards/adaptors then go ahead! But you can't copyright the solutions emerged in this discussion to stop others from producing their own.

*My thought is that after a working prototype series is made to work we could dispose of the cumbersome ISA cards and produce a small (matchbox size) card that would easily fit inside any Atari. The Realtek card I have at home only needs the surface of a matchbox to fit its single chip and capacitors.

CONNECTION TO PROCESSOR BUS QUESTIONS:

*What about the Lo-byte Hi-byte issue concerning ISA cards on the Motorola bus? Do we flip the data bus or the address bus? In fact this is also a qustion for the cartridge and DMA solutions.

*What hardware address to choose for the memory mapping of the ethernet interface? Is one foreseen by Shiraz Shivji & Co? The Riebl card obiviously must have some address it dwells on?

*It looks to me as if this project can be realized in a very similar manner to the TOS 2.06 decoder for the ST series and even more the IDE interface. Any thoughts?

Hi!

When I was doing research on a possible 1040STf motherboard replacement, I ran accross the 68K systems out there that use ISA cards. Perhaps we ought to contact that crowd for some help.

Isn't there already an ISA-card adaptor for the Ataris somewhere? I think someone mentioned it sometime...

If it exists and it accepts any ISA card, it would of course accept an ethernet card, and then it is a move to step #2: software driver(s).

If it doesn't exist, maybe it would be better to design that first, as it might be useful for other purposes, too, and then move on to ethernet job.

But we are, perhaps, drifting here into the waters of Atari-emulated-on-a-PC, and the point that Pera Putnik made: that the future of Atari may be in emulation. It may be cheaper and better to concentrate efforts onto producing a a really good Atari emulator (practically an alternative OS) on PC hardware, using the brute power of fast Pentiums. And then we would cheaply have all the interfaces we need- ISA, PCI, USB, network, IDE..., and retain the use of a familiar TOS (and/or derivatives) operating system and applications.

Cu.

Of course; silly of me- I forgot. Actually, I had in mind all the time only
the TOS 2.06 ROMs at $E00000, and the 256KB free after them.

There are several options, the simplest is ghostlink, PC becomes the
slave, ATARI the master and you can transfer files from/to PC using the
ATARI desktop and a null modem cable.

Using MagiC_PC under window$ and a single floppy (!) for the ST you
can use STinG/BNeT to access drives/files/printers etc on both machines
(like M$ networks, except that it doesn't take ages to connect and does
not use passwords :).

This setup plays better of course, if the STE has a hard disk, 4MB RAM and runs MagiC ;-)

The only problem is the slow speed of ST's serial port. There is a hardware modification that can increase the speed to 57600 bps IIRC. Check HS-MODEM docs or ST related sites.

Now for Ethernet. MintNet has a driver for DLink DE600 pocket adapter that plugs to the cartridge port. If such an adapter can be found, you can use NFS to connect to the PC (I haven't tested this).

Realtek pocket adapters should be easier to find as Genius LAN, ZOT pocket adapter etc. I've written a STinG driver for this chip and use it for the last couple weeks to connect to the PC through FTP or HTTP, STinG has no NFS for the moment.

Take a look in my homepage or the Belgian FTP server at: "193.190.204.128/atari/network/ethernet/realtek" or Karl Samyn's page at "http://gallery.uunet.be/saka/atari/network/"

Take a look at:

ftp://193.190.204.128/atari/network/ethernet/realtek/

A fully working(?) DIY cartridge port adaptor for pocket Ethernet
adaptors complete with PCB layout and a STiNG driver!

Looks very promising.

My Vote would have to go for a cartridge port solution to interface ISA
3-COM Ehterlink 3 adapters....Heres why...

Cart port is easily accessible to most Atarians unless, like some of my
recasers they are a bit hard to get at. Musicians with cart-port dongles
prolly aren't too fussed by networking anyway....The clock carts I've aseen
have got through ports anway so that should be a non-issue.

Why 3-COM ELINK3's....well they're everywhere and cost peanuts. You can get
the ISA ones in this country for about 5 UKP, so linking up to a PC will be
trivial, equally getting hold of ISA sockets even though they're becoming
obsolete will never be hard for the next decade, push comes to shove you
can strip a 386 PC for half a dozen any time you want....

I can offer to do the layout, I use SCOOTER PCb on a Falcon and it'll
handle a lot of layers if it needs to although I'd try to get it into
doublesided if I could...We'd need to box it somehow or do what Titan/Core
have done with the Eclipse and run a ribbon cable to a seperate box for
the card (the same one they're using will do...), raising the possiblility
of multiple cards being made available, though what you can get beyond
extra paprallel ports and possibly HD IDE and SCSI boards that'd be

worthwhile is another matter.....Soundblaster anyone?

hmm, yes this has been asked before...

> If so what software hardware is needed to do it?

That depends witch solution you want.
You simply can connect them using a serial nul-modem cable... or a special parallel cable.
You can also connect them using an ethernet network (is rather expensive).

You should decide if you will need the connection a lot.

Take a look at my pages, maybe you'll get a little wiser :-)

http://gallery.uunet.be/saka/atari/network/index.htm
http://gallery.uunet.be/saka/atari/lan/index.htm
http://gallery.uunet.be/saka/atari/faq/index.htm

If your browser supports java-scripts, you can use this wizard to find a good solution.
http://gallery.uunet.be/saka/atari/faq/wizard.htm

```
Hope this helps.

I have a pile of old computer mags - mainly Computer & Video Games but some
other bits and pieces.  Due to be filed under 'bin' unless anyone wants to
come and get them (location Manchester UK)!

Rob

Hi

Just a short note to mention that you can now register for Atari shareware via CyberSTrider using your Credit Card (Mastercard/Visa) or Debit Card (Switch/Delta) via my web site.

http://www.cyberstrider.org/

follow the link that informs you of the online payment system. No need for Americans/Canadians to send me Dollar cheques/International Money Orders.. and no need for Europeans (non UK ones I mean ;) to send me Eurocheques.. just pay via the site...

You may also be interested to know about things my other company (Cyberstrider Limited) is doing... (domain names, web hosting, ecommerce)

www.cyberstrider.net

Hello All!

few weeks ago I've bought an old ATARI 1040 STfm. But there is no any
docs with it

There are some connectors which I recognize - HDD, Printer, B/W monitor

etc.   But on the left side I've found connector, near MIDI In and MIDI Out,
which   hasn't any describe. It's 20-pin, one row like short ISA-slot,
female. What should It be?

That's the cartridge port. You can use it for dongles, cartridge
software, an I/O interface, a real-time clock, etc...

The monitor port is for both monochrome and colour monitors, it detects
which kind of monitor is connected and switches the ST to the right

video mode.

Alas, I've got only B/W monitor, so I want to connect my Sony TV to ST. I
suppose, It can be done through TV antenna, Isn't It?

Correct, but that's a composite display, which is slightly inferior to the RGB output that comes from the monitor connector. You would need a special cable and an RGB input (like a SCART connector) on your TV to use it. Some countries do not use SCART, that's why Atari included an RF composite output in the STFM.

Hi

I am after the diagnostic cartridge that Atari did for the Atari ST series. Ideally with manuals etc.

Thanks

I recently bought a puzzle for $15. I'm not much one for puzzles, but this type I like....

It is a Atari TT, and this is what I've got so far....

"An Atari TT030 computer that is DEAD, NON-WORKING, INCOMPLETE, being sold FOR PARTS. Is missing keyboard, floppy drive, TOS ROMs, Hard Drive, Hard Drive Mount/shell, and a few other chips/components. Also does NOT inlcude any cords, mouse, or other cables. *Does include* the 68030 processor, power supply, VME cage, all connectors on back including the VME cover plate with two serial ports mounted on it. While there may be a chance that this computer could be fixed, I am selling it as a PARTS MACHINE ONLY."

Alright, the way I see it, the parts list is looking like this:

Missing list:

keyboard - I have a Mega ST keyboard. Would this be compatible?
floppy drive - No problem.. common.
TOS ROMs - Possible problem... anyone know of anyone who burns these?
Hard Drive - no problem.. common.. though the cables from the motherboard to the hard drive might be a problem.
Hard Drive Mount/shell - One could be fashioned to fit... might be challenging.
and a few other chips/components - again, possible problem, since more than likely these chips taken were probably rare. Anyone deal in ST/TT components?

cords - From computer to monitor/hard drive.. little problem
mouse - absolutely no problem.
other cables - "other" cables? Internal? Possible problem.

As for what's included... "68030 processor, power supply, VME cage, all connectors on back including the VME cover plate with two serial ports mounted on it. "

I'm relieved that the processor is there, and power supply... my only question is how good the motherboard and power supply is.

So these are the parts of the puzzle. I'm curious to sources for TT computer components, and where I can find specs so I can know what other parts I need to look for.

Thank folks for your helpon this savenger hunt!

Doctor Clu

Yes, the RCA connector on the back of the ST is the output from the RF
Modulator. This plugs directly into your TV's antenna socket.

: I recently bought a puzzle for $15. I'm not much one for puzzles, but
: this type I like....

:   It is a Atari TT, and this is what I've got so far....

: "An Atari TT030 computer that is DEAD, NON-WORKING, INCOMPLETE, being
: sold FOR PARTS. Is missing keyboard, floppy drive, TOS ROMs, Hard Drive,
: Hard Drive Mount/shell, and a few other chips/components. Also does NOT
: inlcude any cords, mouse, or other cables. *Does include* the 68030
: processor, power supply, VME cage, all connectors on back including the
: VME cover plate with two serial ports mounted on it. While there may be
: a chance that this computer could be fixed, I am selling it as a PARTS
: MACHINE ONLY."

Can't really beat the price...

: keyboard - I have a Mega ST keyboard. Would this be compatible?

Yes; it'll be plug and play.

: floppy drive - No problem.. common.
: TOS ROMs - Possible problem... anyone know of anyone who burns these?

If you can't find someone to burn some for you, check out Best Electronics for new ones.

: Hard Drive - no problem.. common.. though the cables from the
:   motherboard to the hard drive might be a problem.

Nope, it's just a standard SCSI cable,

: Hard Drive Mount/shell - One could be fashioned to fit... might be
:   challenging.

You might want to consider re-casing the TT in a PC tower case. Benefits include a good power supply, room for more than one internal SCSI device, better looks (depending on your opinion of the TT "wedding cake" case), and the ability put the computer somewhere else than on top of your desk.

: and a few other chips/components - again, possible problem, since
:   more than likely these chips taken
:   were probably rare. Anyone deal
:   in ST/TT components?

Check out Best Electronics again.
http://www.best-electronics-ca.com/

Don't forget to unplug, or use a monitor switch box, the MONO monitor
otherwise you won't be able to use a TV.

Newsgroups: comp.sys.atari.st.tech

Hi everybody

I have been experiencing some problems in receiving some mail messages using Newsie0.94 (any update available by now?). The symptoms are the following : when I check for new mail, I get the dialog box with "x new messages" displayed (1 or more messages announces), then the right number of message is downloaded on my machine. But when the inbox list comes up some messages are missing. I checked on the mail directory (date directory) and the missing message is there, and can be shown apparently without glitches using the desktop. The messages were sent from work using ms exchange (sorry...).

Has anybody a hint as to what the problem is ?

Thanks for listening

Cheers

Stephane

I have an old piecemeal ST harddrive system with an ICD Controller Card. I rarely use my ST anymore, but this system has worked fine for years. Recently, I turned on the hard drive and heard the usual startup sounds from the power supply and drive, but the ST could not find the controller card. After closer examination, I saw that the card has a battery on it which was dead. So I replaced the battery, but still nothing happens. How can I get this antique system going again, or at least determine with a multimeter if the card is indeed not working?

If necessary, could I also find an old prepackaged ST hard drive and transfer the data from my existing drive to the new one by hooking it up to a PC?

Thanks,
Steve

The battery is just for the clock that's built into these old ICD card.

You could try contacting ICD, they still have a web site somewhere, but from experience, the drive mechanism usually fails well before the host adapter. Maybe you could try attaching a new SCSI unit to it (with the same drive ID and parity off).

> If necessary, could I also find an old prepackaged ST hard drive and transfer the data from my existing drive to the new one by hooking it up to a PC?

Finding an old hard drive would be difficult nowadays. You'd have to get a modern SCSI/IDE drive and adapter. Besides, a PC could not read that old atari drive.

Recently I recieved a 520STfm and a 1040STf in a trade. They weren't packed all that well and the keyboards got damaged. Outwardly they look fine (except the STf where the space bar is in two pieces), but all of the keys left of the 6-T-G-V line give no reponse. This is true of both. I disassembled the STf keyboard and discovered the PCB had been pushed in against the middle support column until it (the PCB) gave, making a 2 cm uplift with broken traces. After running wire wrap wire between the affected trace end points, I got the majority of the keys to work.

My problem now is that the 8-0-= keys and both of the shifts do not respond, although CAPSLOCK does. Does anyone have any ideas or previous experience that may shed some light on where to go next. Thanks in advance.

Hi

I've given up trying to patch keyboards where the support goes through,
you can never guarantee it'll work 100%.

I may have a spare keyboard knocking around somewhere, depending where
you are:)

PhotoChrome 4 and two of the Nifty viewers from the Apex package.
These are just viewers.

Hi,

Many years ago, I acquired a "PC-Speed" device which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

HI,

I recently recieved what I believed to be an old IDE interface, but to be honest I'm not sure.
It consists of two seperate boards around 6x8 and 6x6 inches in size.

One has the following written on it ICD Advantage Plus ST. date 1990.
This connects to the hard drive port on the ST and also has an out port which looks like could connect to another ADHI device. This board connects to the second board by a 50 pin cable.

I've looked at the ICD page and found this is a SCSI adaptor....

The other seems significantly older, has no date on the board itself but the chips date from 1983-4. And one of them is even made by (horror!) Intel!
It has a jumper block labelled A to O with no jumpers.
It has two 20 pin and one 34 pin cables with 'edge connector' type fittings. Which I guess go to a drive of some sort but look nothing like the modern IDE cables I know from PC's.

IS this second poard some odd SCSI to IDE interface or what?????

If anyone out there could give any additional info, fitting instructions etc. I'd be very greatful.

Thomas

I think so too!

I don't remember ICD ever making IDE interfaces.

Sounds more like a SCSI to MFM converter.

AFAIR, Xebec used to make these, & I used to use them a long time ago, back when SCSI was expensive & hard to get. They have 20 & 34 pin interfaces to the old MFM winchester disks. The 20 pin cables carry control signals.

It's a very slow way to go though, & I stopped using them in favour of SCSI drives.

I guess you can use the ICD Advantage board if you can get hold of a SCSI drive or two. Any old PC MFM drives you find will be old, slow & probably have less than 100 MBytes capacity.

The second board is probably a SCSI to MFM/RLL adapter or maybe ESDI.
The SH-204 series used one of these along with a ASCI-SCSI converter.
Odd that someone would use with an ICD.

The board is probably made by Emulex- you see a lot of these in the Sun
3/3x series systems, and to a lesser extent STs and Macs. I guess
MFM/RLL drives at the time were just cheap enough to justify these
boards and when SCSI got cheaper, they vanished into the backs of tech
rooms in droves. Hop this helps.

Eric

This is the Partridge Port. Used for various applications, e.g for Dongles for CUbase and other such software, for scanner interfaces, for a real time clock. The Spectre GCR was a mac emulator that used this port. Diagnostics cartridges are also available from Best Electronics. Fast Basic was program that used to use this slot.

Saif

P.S. if you want a copy of the manual, I've got one spare.

Hi,

Many years ago, I acquired a "PC-Speed" hardware device which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

Don't know any other software. In some cases it is possible to fit a graphics card - easier on Megas and TTs as they have an expansion slot for the bus, though I believe it can be done on STFMs too with a lot of soldering. But these cards are hard to get and tend to be expensive!

>
>I've looked at the ICD page and found this is a SCSI adaptor....

It is a host adapter that converts Atari's DMA signals to SCSI - later replaced by the Link and Link 2, but should work OK with all SCSI (*not* IDE!) drives (I've used one for 2 drives, including a SyQuest 44). The chances are that your 50-way cable has a plug on the end that goes directly to a SCSI drive embedded controller board (i.e. an internal connection, not the external large-D usually used to teh box).

>The other seems significantly older, has no date on the board itself but
>the chips date from 1983-4. And one of them is even made by (horror!)

Probably for setting the LUN or ID.

>It has two 20 pin and one 34 pin cables with 'edge connector' type
>fittings. Which I guess go to a drive of some sort but look nothing like
>the modern IDE cables I know from PC's.

This is almost certainly a hard drive controller for older ST506/412 type hard drives that don't have an embedded SCSI interface - I believe they are MFM or RLL. Not much use with modern drives!

Fitting instructions and much more were in the ICD AdSCSI ST Series booklet. I had a spare but sold it. Try and get hold of it - it contains much useful info on building a hard drive as well as description of the ICD Utilities, some of which seem to be available PD.

PhotoChrome will work on both STs and STEs although its 19700 colour
mode only works on STEs.

A little pricey!!!

There is little difference in the ST manual that deals with the STE, or
TOS 1.4 (Rainbow TOS) come to think of it, the enhancements are on a
blue card!!!

If you are still after a manual, drop me a line; this will give me time
to dig it out:)

Ok this is the classic fix for this problem.
there is an old proggy called make512.prg
and it sets up a ramdisk that uses all other memory but 512k
and that will allow most games to work.

or a big ram disk will also help

The TGA viewer will work on ST's, and I thought the GIF viewer would
too, but I don't have an ST to confirm that. The JPG viewer is Falcon
only (in the Apex Kit).

There was also a paint program called GFA Artist that allowed 1088 colors on the screen in a static lo-res picture. According to the advertisement. I have never tried this program so I don't really know if this is really possible or not. It also suppose to have animation abilities as well. Sounds interesting, does anyone have this program? If so, give us some details on it. ;)

The Atari Software eXchange

Updated: Saturday 17th July 1999

I have the following Atari gear for sale. Prices do not include postage.

Prices are in GBP's (Sterling) and I'm also willing to accept USD's.

As usual I will consider part exchanges or swaps for other Atari St, Jaguar, Portfolio etc. hardware or software.

Things I'm on the lookout for:
Atari CD-ROM's, reference books, EPROM Programmer that can do 32-pin DIL chips.. or anything that tickles my fancy;)
****

Atari ST Compilation Packs
Atari STE Discovery Xtra Pack, featuring:
Final Fight, Sim City, Escape from the Planet of the Robot Monsters, 9 Lives and the Language Disk. ..... �5

Atari 520STE Turbo Pack, Featuring:
STOS, Hyperpaint 2, Music Maker 2, FirST BASIC, Blood Money, Anarchy, Human Killing Machine, Impossible Mission, Dragon's Breath, Indianna Jones and the Last Crusade, Outrun, and Super Cycle. ..... �15

Compilations
�3 Each
Top Shots, featuring: Kick Off + Extra Time.

�4 Each

Hollywood Collection, featuring:
  Ghostbusters II, Indiana Jones and the Last Crusade & Robocop. No Batman or instructions.

�5 Each
Champions, featuring:
  Manchester Untied, World Boxing Championship & Jahangir Khan Squash. No Box.

TNT, featuring:
  Xybots, Toobin, APB, Dragon Spirit & hard drivin'.

Mega-lo-Mania & First Samurai.

Educational

�4 Each
Learn to Read with Prof. Level 1. Ages 4 to 9. Not STE.
Mickey's Runaway Zoo (Disney Software) - Learn Numbers for 2-5 years.

Adventure, Strategy, Puzzle & Trivia type

�1 Each
Spidertronic

�2 Each
Crash Garrett
Go-Moku/Renju
Quizam!
Skweek
The Quest for the Time Bird
Tower of Babel

�3 Each
Advanced Dundgeons and Dragons 'Heroes of the Lance'. No box.
Borodino
Chess Player 2150
Corporation
Curruption. No Box.
Driller. Including a model of the planets surface.
Dungeon Master Editor. No box.
Dungeon Master Expansion Set #1 - Chaos Strike Back & Utility Disk.
Federation of Free Traders (F.O.F.T.). No box.
Lords of Chaos
Murder

�4 Each
Operation Stealth

�5 Each
Carrier Command
Kings Quest I. No Box.
Kings Quest II. No Box
Kings Quest III. No Box.

Buy all 3 Kings Quest Adventures for �15 inc. postage (UK only).
Leasure Suit Larry in 'The Land of the Lounge Lizards'.
*** WARNING ***
Leasure Suit Larry contains ADULT Material.
Parental guidance is suggested.
Powermonger including World War 1 edition
Shadowlands
Space Quest. No box.
Terrorpods

�7.50 Each
Civilization. 1 meg. No Box.
Midwinter II Flames of Freedom. 1 meg.

�10 Each
Frontier - Elite II. 1 meg.
Indy - Indianna Jones and the Last Crusade 'The Graphic Adventure' (6 disks). I've no idea if this needs 1 meg! It comes with The Arcade game as well.
Populous II. Both 1 meg and 512k versions.
Railroad Tycoon. 1 meg.

Simulations
�2 Each
Hunter Killer

�3 Each
Falcon The Mission Disk Volume 1.

�5 Each
Battlehawks 1942
Falcon. The F-16 Fighter Simulation. �7 including Mission disk 1.
Flight of the Intruder. Additional Features for 1 meg owners.
Gunship
Mig-29 Fulcrum. 1 meg needed.

�7.50 Each
Formula One Grand Prix (Microprose)
M1 Tank Platoon

�10 Each
F-19 Stealth Fighter.
Knights of the Sky. 1 meg.
Reach for the Skies. 1 meg.
Silent Service II. Requires 1 meg.

Sports
�2 Each
Football Director II
Hyperbowl. No Box.
Super League Soccer
World Cricket

�4 Each
Kick Off 2 + World Cup 90

�5 Each
Sensible Soccer. 1992/3 Season Edition. Computer Game of the Year '93.

�10 Each
Championship Manager End of 1994 Season Data up-Date disk.
Comes with Championship Manager (1 meg) and Championship Manager Italia. Altogether 8 disks.

Arcade
�1 Each
Nitro Boost Challenge

�2 Each
Alpha Waves
Bad Company
Ballistix
Cabal
Defenders of the Earth
Fast Food. Featuring Dizzy.
Flood
Formula 1 Grand Prix (not Microprose)
Hard Drivin'
Hong Kong Phooey
Mean Machine
Outrun. No instructions, you don't need them.
Popeye 2
Robocop
Steg The Slug
The Light Corridor
Whirligig
Yogi Bear & Friends in the 'Greed Monster'

�3 Each
Awesome
Barbarian (Palace). The one with gladiator 'Wolf' on the box.
Barbarian (Psygnosis)
Cap'n Carnage
Captain America. No Box.
Championship Wrestling
Chase HQ II. No Box.
Combo Racer
Daley Thompson's Olympic Challenge. Not STE.
Defender II
Dragon Breed
First Samuri. No Box.
Golden Axe
Harley-Davidson 'The Road to Sturgis'
Hudson Hawk
Impossamole
Mach 3

Menace
Monty Python's Flying Circus. No Box.
Operation Thunderbolt
Oxxonian
Prince of Persia
Risky Woods
Robocop 2
Shadow of the Beast
Speedball 2
Spindizzy Worlds
Spitting Image
Star Breaker (Brand New) Still Shrink wrapped.
Star Wars
Super Hang-On
Switchblade II
Teenage Mutant Hero Turtles
Test Drive
The New Zealand Story
The Simpsons - Bart V's The Space Mutant
The Untouchables
Thunder Blade
Total Recall
Vigilante
Wizkid. No Box.

�4 Each
Ghostbusters II
Lotus III

�5 Each
Street Fighter II

I installed a Reflex graphics card in my STFM - originally designed to plug
into the processor bus of a MegaST. Lot of soldering involved...

  I observed problems only with few games. Flight of Intruder not works due
to changed V-blank routine.
But if you have enough free RAM, you can load some older version of TOS, and
run problematic games.
  One of TOS-loaders you may find at :
http://members.tripod.com/~piters/atari/tosload.htm .

         Pera

Does anybody have an extra Atari ST mouse they would not mind parting
with? I recently picked by a 1040ST without one.

I'll pay a fair price, or maybee we can trade

>downloadable?

No, you don't. There's absolutely no useful information in the manual,
except the connector pinouts maybe.

>Thanks for your help!
>
>(Our problem here is: How has an internal harddisk to be connected to the
>mainboard?!)

It can't without a 3rd party adapter board. Check out the Quick FAQ.

Nicholas

I was going through my garage last weekend, and found tons of older IBM parts out there. Stuff like old MFM hardrives and such. Is any of this stuff usable for my old 1040 ST? It's pretty much useless on my PC, but my ST could use a harddrive.

Thanks!

yes I have quite a few but do you know the internet works all over the world? so some clue where you are would be a great help as it is not worth posting something like that half way round the globe

Hi,

Many years ago, I acquired a "PC-Speed" hardware device from SACK Electronic GmbH, which would plug over the 68000 CPU of an ATARI STe, and give access to DOS based programs.

In fact, I never went on to installing the device, (probably because I didn't want to void the ATARI's warranty), and the box laid in the back of a drawer for many years. Finally, I have decided to give it a go. I have all that is necessary (the board, the software) except the installation leaflet which presumably explains the hardware installation procedure (in particular, which way round you should install the board). My board is specifically for STe's (square type CPU).

So, if anyone has experience with this, and has kept the installation leaflet, I would be very grateful if you could send a copy (either scanned leaflet, or just the instructions).

Thanks in advance,

Patrick

french-lines@usa.net

Alternatively, anyone know if this SACK Electronic GmbH is still around ?

Hi to all,

I have posted a question regarding ST blitter chip, but haven't seen any

response so far. Besides that I'm not sure that message made it's way
from my mailserver, so I'm repeating it. My apologies to those that
might see it as a harrasment.

I have been looking at Blitter data (that can be found on the Web)
lately and I think that DSP like AD's 21xx could be persuaded to play
that role
very effectively instead of original part.Since I have in my drawer a
few 2181's and 2115's, I would like to play with them...
But there are quite a few holes in my Blitter-related data, so I'm
curious about:

1. The role of the FXSR and NFSR bits in the last register of Blitter
($FF8A3D)
What good is to perform one extra source read at the beginning? Does
that
read affect all counters? Similar questions arise at NFSR bit (No Final
Source Read)...

2. I found somewhere mentioned that "Busy flag behaves exactly the same
as
interrupt line". Does that mean that Blitter requests an interrupt after

operation completion?

If so, which line is it & who generates interrupt vector for it
(GLUE,MFP,
Blitter) If Blitter is responsible for vector generation, which vector
is it
?

3. In which mode does Blitter acces memory (User or Supervisor)?
I mean, that thing covers entire address range of the 68000 CPU...
What would happen if Blitter starts transfer from/to some protected
area,
like first two kilobytes of memory or system registers which are over
15Mb
boundary ?

I seem to remember reading a document from Atari, describing Blitter
from all angles (registers, bus timings, pinout, all electrical specs
etc), but that was many years ago and I can not find it now. Do anyone
knows something about it?

Thanks in advance,

Branko.

Good development, but realy slow. ANY old 286CPU would be faster..

All what i know is that some releases needs a newer driver.
You need a DOS part. on your hard drive.

> Alternatively, anyone know if this SACK Electronic GmbH is still

Hi!

I've finally got a new RAM-card for my STacy, it has 2Mb soldered in a 2
free SIPP-slots. I converted two 1Mb SIMMs (soldered on 60 small pins...),
but the STacy still recognise only 2Mb. Must I do something else than just
insert the SIPPs? If not I'm afraid I've destroyed the SIMMs :-(

Btw. if anybody has two SIPPs (8x1Mb) to sell me I'm very interested.

Btw2. I also got a new PSU for the backlight, so now I've got a very
bright and clear backlight on the STacy :-)

I couldn't find any, but I'll take closer look.

> > Btw2. I also got a new PSU for the backlight, so now I've got a very
> > bright and clear backlight on the STacy :-)
>
> Details? ;-))

We all know that the backlight on STacys deteriorates with use, and it's usually the electroluminescent sheet that deteriorates. This is impossible to repair, it must be replaces. Apparently you can buy sheets and cut it to size, but it's expensive.

In my case I was lucky enough to get a STacy that has been used very little, so the EL-sheet was OK. But the PSU (the internal one, with the

100VAC trafo) was broken, so the backlight didn't come on until the trafo was heated up. With the new PSU the backlight comes on instantly and is very bright.

Dear sir or Madam

I was wondering if the Atari STE 520 which I bought in the UK would be compatible with the NTSC Standards? If I was to get a plug adapter to change it from a 3 pin plug to a two pin plug, would it work?

If not what would I have to do to make it work?

Hi,
 I just bought a bunch of Atari items including an ICD Fast drive and an

SH204.
I managed to get the ICD drive up and running, but the SH204 is a
problem.
Running ICD utilities I find nothing on the Scsi or Asci bus, using HD
Driver
7.5 I find a QMTI on Asci 0,0 and 0,1 but if I go to format or partition

nothing
is found. Using Supra utilities shows an adaptec 5500 controller, but
again no
valid devices attached at the format or partition stage. The unit has a

dip switch
inside, does anyone know the correct settings for this or have any other

solutions ?
Any help would be greatly appreciated.
Jim Donovan

I have a STACY that I expanded by dropping in 2 SIPPs (9 bit * 1Meg).

There is nothing more to it than inserting the parts. Mine came up instantly with 4 MegaBytes.

I do recall a mechanical fit problem: the SIPPs caught on something and the pins wouldn't line up right until I filed a bit of protruding plastic away. But that was the only problem I had (Typical of Atari construction.)

If your talking about the composite output, no. The crystal for the RGB
encoder is different. If could be changed however if you
like to solder a little and can find a replacement crystal. Not a big
job. The encoder used in Ataris is still available, and the data
sheets are available. All that providing your machine has an RF
modulator. If it dosen't, the encoder is still there, but there will
be some other items missing you will need, one of which is a delay
circuit. The spec for the encoder detail all that is required to
install one if you have the hankering.
I had a UK PAL C-LAB Falcon, and it worked fine with a VGA and SC1224
monitor, but again the same problem, the RGB encoder was clocked for
PAL and composite video didn't work on an NTSC system.

I could do with this info too as I have an SH204 with similar symptoms...I also have a BMS-100 drive (similar MFM set up) that I'd like to try to use...

Hello!

I need a couple of things,

I need an internal IDE cable for the Falcon030. The one I got did not have one and trying to get a cable around here in Cleveland is darn near imposible. This will be for sound system of my church.

Secondly, where can I get the schematics of the composite adaptor for ST's that have the composite video out?

Regards,

Jim

>
> 1/: Overclocking

Overclocking is a term from the PC world where you can change CPU clock
frequency. In this case, you want an accelerator board like the Veloce.
http://tusdev.demon.co.uk

> 2/: Hard disk connection (IDE)

The same company also builds an internal IDE adapter board. For it to fit inside a standard STE case, you will need a 2.5" drive. I think they even have a combined board that includes a Veloce+IDE adapter. Get in touch with them.

> 3/: putting PC RAM on it

"PC Ram" doesn't exist. You want 4 standard 30 pin SIMMs, 1Mb each. Plug'n'play.

> 4/: Floppy disk (720 ko)

It's already got one. Maybe you mean a 1.44Mb drive. This is in the Quick FAQ.

> 5/: motherboard electronic maps

Links are in the Quick FAQ.

Hi all

I have an USR sportster flash modem, now running 56000 bps (actually 52000 at best) in X2 mode. I would like to update the

flashrom to get V90 access. I visited 3com/usr site and got (on
the french site) a .exe file for PC!
Is it possible to flash the eprom in my modem from the Atari
(falcon) or will I have to get it done from a PC ?

Any answer welcome

Cheers

Stephane

Bad news - I think you'll probably have to use a PC to update it.

I once made the tragic mistake of following the prompts using their modem update "Wizard". They should call it the Modem Update Dunce. Anyway, in the process of getting the modem operational again, I learned the data files are stored in a proprietary format.

Hello,

If anyone has a specific driver for the laserjet 5l could you please
send me it.  I cannot get my 5l to print legal or legal four color sep.
For some reason it quits printing at about the 11 inch mark.
I have two people trying to fix it but If there are any specific drivers made
for this printer then it might just be that.

please email me if you do or respond.

I have a MC6800P12 processor from an old IBM laser printer. This is as far as I know pin-compatible with the 68000P8 in the 520STm. I wonder if it is possible to put this in my ST and (with some modifications) get it to run at 12 MHz?

This has already been discussed. AFAIR, the conclusion was that just to replace the processor would not give you a significant gain. You would actually have to add some sort of cache in order to compensate for the other system bottlenecks, which would end up probably looking like something like the Veloce or PAK accelerator boards

You don't haven't installed the user accounting mechanism. In this file
the actual user informations are held.

Get a newer version of MiNT-Setter. mintsett38.zip is actual, you can
find it at http://www.cs.uni-magdeburg.de/~fnaumann/mint/1.15.1/

It would be difficult to get a 12 MHz CPU to work in the ST, since the other devices run at multiples of 8 MHz. You can replace the CPU with a 16 MHz version, or replace the original CPU with a 12 MHz version, or even just wire the original CPU to a 16 Mhz clock (usually got from the shifter), & with a little decoding logic, you can have the CPU running at 16 MHz.

True, the speed increase is minimal, something like 10% average.
But, this is noticable & there are advantages to having your CPU running faster, like the interrupt latency is reduced & the screen redraws quicker.

Some internal CPU functions can be up to 90% faster (Mul & Div for example).

It is true that this combination won't beat a MSTe, but for approx $1 & a bit of time, it makes the ST a bit livelier.

Running the old CPU @ 16 Mhz works for most of the devices I've tried, & after 5 years, there are no early failures.

An even better solution is to run the whole ST @ 12 MHz, a little more challenging to get right, but everything will run 50% faster.

Aaccelerators with faster/extra memory will always produce good results.

Hi Nick. I think you're right, but just out of curiosity-didn't Peter R., the STing author, use some kind of rigged ST that runs at 12mhz or so? I can't remember all the details...

This reminds me of the "will a 68010 make my ST run better" thread. (it won't, really)   ;-)

hi all,

i need to plug an atari 1040stf on the hi-fi, but it has no jacks like
the ste does.

so i've been thinking, is there a way i can hack my st peritel cable to
get stereo jacks ?

any help will be appreciated.

My original ST , a 1040STF now with TOS 1.04 and 2.5mb seems to have
developed strange habits.

It boots up properly and most programs and functions work as intended.
Atari Basic, Logo etc all work properly. However it has taken a
dislike to certain programs.

e.g. #1 A disk in the Atari Power pack game set - Disk G. It will run
Pac-Mania and Eliminator but not Nebulus. The latter simply stops
loading. The title page never appears. The disk and program seem ok.
At least they work properly on my MSte. It doesn't appear to be a
disk/drive incompatability in the 1040. The 1040 will copy all the
Nebulus files to a ram disk.

e.g. #2 CAD3D - the program nearly loads - the workbench is drawn but the program then locks before the mouse pointer is drawn. This happens with either the colour or mono monitor. Again the disk appears not to be the problem. It works on the MSTe and a copy is no better on the 1040.

This behaviour is absolutely consistent. It doesn't matter whether the 1040 is hot or cold or anything else I can think of. And yet the 1040 will happily boot Magic and surf the net with STiK or STinG (admittedly not very quickly).

Has anyone met anything like this?

Look in the Aminet file archives at uni.paderborn.de for Amiga Hardware/Hacks. There are several implementations for a faster 68000 (and also the 68010) that should be adaptable to the ST. Some are brute force hacks (with questionable effects on the rest of the system) and some are rather more involved technically and more self isolating timing wise.

On the same note, there is a PD design for a 020/881 accelerator at ftp.funet.fi (lucas.lha) that is pin compatible to the 68000 DIP socket. Perhaps it may be usable on the ST as well.

The ST monitor jack has a mono audio pin (normally goes to the speaker in the SC/SM monitors). This can be fed by a y-splitter to a stereo.

ST's I've had with these symptoms develop overheated capacitors in front of the RAM chips. They are noticably blackened and cracked. Similar symptoms also occur with oxidized chip contacts. Remove and reseat all socketed chips.

PR did probably boost up a Mega ST, which is more "boostable" than an ordinary 520ST. The hack is (in short) to detach the clock feed to certain chips and then provide them with a new source that will give them their old and only sensible frequencies. ACIA:s with 500KHz, the soundchip with 2MHz, the FDC with 8MHz and maybe some more. This is in fact an exclusion from the speedup of the rest of the system. For instance, an FDC fed with 12MHz would give you a unique disk format, and you wouldn't want that, would you?

These old-new clocks are normally achieved by removing the system main oscillator and using it to feed the above mentioned chips through a divider circuit, for instance a 74xx4040. Two divisions of 32MHz gives 8MHz, four gives 2Mhz and six gives 0.5Mhz.

In place of the old 32MHz oscillator you can put a 40MHz or a 48MHz. Divide the speed of the oscillator four times and you get the system speed. For a 48MHz oscillator you'd get 12MHz.

All nice and easy? Not quite. Your shifter chip, which makes the picture, will run faster as well and this will result in a distorted picture. One remedy is a sequencer with tables in an EPROM which restores everything to "normal" on the screen. This will also open up a possibility for an extended (overscanned) graphics mode, like URA:s Lacescan.

Another way is to have a separate graphics card.

The matter of 68010 is that it really speeds up some things, but V-E-R-Y marginally. You must have a TOS 2.06 to be able to use a 68010.

The only really sensible solution to get a faster ST is to buy a speedup board. Or even better a new computer, like the Milan or Hades.

By the way, Hades? Medusa? Who came up with these "cute" names? What's next, an Anticrist with quadruple 68060:s?

"I is the enemy"
"I is anarchy"

Hi everybody,

I would like to know if it's possible for me to connect my ST to my BNC
network of PCs ? Can I also do it with my falcon ?

Thanks
Julien

The %20 and &32; are called standard_url_encoding.
This converts spaces to the + sign, and non-alphameric characters into
a % followed by 2 hex digits, and line breaks into %0d%0a.

NEWSie does not perform any translation of those characters in a
subject= parameter, but could do this as part of url-encoding
enhancements. It may get added to 0.96.

Other browsers tend to ignore spaces, but should accept the '+' and
translate those into spaces. Try it...

John

Nope, but you can connect with a serial null-modem.

This is in the Quick FAQ

It could be that those programs dislike your wierd RAM configuration
(Atari never supported 2.5Mb machines), or just are incompatible with
TOS 1.04
```

```
What with different drives, TOS versions, RAM, blitters, video modes,
etc... STs from various eras are hardly 100% compatible with each other.

Nicholas,

Your suggestion may be the right one. I normally use the 1040 only for
special purposes. I only discovered the problem because my son wanted
to try a few old games and the MSTe was being used by my daughter.
It's likely that I have never run CAD3D on it in its current
configuration, but I should have thought that the games have been run
on it since. It's a puzzle......

Make new file copy disks and loose the DESKTOP.INF and/or NEWDESK.INF files.
Also disable all accessories.

Hi Eric!

I have an A1000 Amiga (that I keep simply because it has Jay Miners signature on the inside cover), that had a 68010 in it once. Didn't really give much of a performance boost, and in fact cause some probs with compatibility. Talking to Amiga users confirmed that there is little to be gained, and not worth the time/effort involved. Seems the best way to go is at least an '20 upgrade or higher... ;-)

A friend of mine wrote a program for his TT to set any laserjet to legal.
when he runs the program the 5l laserjet blinks to show it revieced the
command. When I tested it on my 1040ste my 5l blinked to show it recieved
the command. But when I tested it on my falcon the laserjet just sat
there and fails to this day to print legal. Does anyone know why this is?
is the falcon parallel buggy or is my parallel port faulty.
my first printer a deskjet 660 failed on me about 4 weeks ago. Eventuall
(last saturday) the good guys replaced it with a brand new 697 which is
working now. But my 5l came in on monday and it was printing at first
and eventually only calamus could print. Double clicking on a .txt file
only locked up the printer into error on both my falcon and my ste telling me
its not the computer....on the other hand the falcon fails to set the laserjet
to legal when running the gfa program.
Can anyone make sense of this? PLEASE HELP!!!!!!!!!!!!!!!!

Does anyone have an Atari ST macro utiltity which allows you to record mouse clicks, and then execute them when needed.

If you have such a macro utility you can contact me at tleonard@netzone.com

With an Mega ST this should be possible if you buy a Riebl card.

> Can I also do it with my falcon ?

If you still can wait a little, it also should be possible with a normal
ST and Falcon. Then you need a pocket ethernet adaptor that connect to
the parallel port of a PC. You will also have to create a little
hardware piece.

More info available on :

http://gallery.uunet.be/saka/atari/network/index.htm

Hope this helps...

Hi All,

I just had my STE recased into a PC case by one of my friends,Chris Crosskey,and what a great job he has done.To connect up Drive A he has used an extended ribbon cable with an extra plug on it and we was wondering whether Drive B can use the same cable.

In PC's they use the same ribbon cable and was wondering whether it would work on an STE by plugging Drive B plug upside down?

All power cables are already installed.

Gordy.

Hi

I can't see why not, as they are connected in parallel anyway. You will
have to set the device number for drive B. Most external Atari drives
have the ID lines twisted so that you can use a drive A drive without
changing the jumpers.

I'd like to know if the same can be done with a High Density drive! I
may know a little info on double density drives, but I know little about
the HD variety;)

Well,I tried it and did not work whichever way I plugged in the
ribbon cable.The problem was that I could access Drive B without any
problems but as soon as I clicked on the Drive A icon both Disk
drives were spiinning around.I could not access anything on Drive A.

The ribbon cable must be plugged in the right way on both drives.
Look at the drive's connector and try to see if you can find out where pin 1 is. Usually it's printed somewhere on the floppy's circuit board.

Should you conncet the cable wrong your drive LED will shine continuosly and the drive will not be accessible, but no harm will happen.

Try each drive alone. If both work as "A:" then your next step is to recode one of the drives from 0 (zero) to 1. This is done by rejumpering somewhere on the drive. Sometimes there is a small slide lever marked |0|1|2|3|, which will do the same job.

Isn't this a bit embarrasing considering you've assumed the name of one of the greatest hardware hackers in history in your email address?

;^)

Reply-To: earthshaker@midsouth.net
Newsgroups: comp.sys.atari.st.tech

I fiddled around with this last night and found that if pins 1 and 4 are swapped (i.e. pin 1 Amiga to pin 4 Atari and pin 4 Amiga to pin 1 Atari), the Amiga mouse behaves normally on an Atari ST. Also, pin 5 (Amiga end) should be connected to pin 9 (Atari ST end) for RMB support. Pin 9 (Amiga end) and pin 5 (Atari ST end) are not connected at all.
OR:

```
Amiga DB9F                                Atari ST DB9M
PIN      Usage                            PIN      Usage
1        Yb-----\  /------------------1        Xb
2        Xa------\/-------------------2        Xa
3        Ya------/\-------------------3        Ya
4        Xb-----/  \------------------4        Yb
5        RMB------                    5        N/C
6        LMB------\-------------------6        LMB
7        +5 VDC----\------------------7        + 5 VDC
8        GND--------\-----------------8        GND
9        MMB----| ----------------9      RMB
```

  I haven't been able to test the RMB portion yet, but if the pinouts I derived the rest of it from are correct- then it should do OK.

Eric

Oops! I forgot to merge the text into text. Thanks to Demon for telling me I had broken my dial up rules!

OK here's how it should have been.

Below is the pin-outs to the Shugart interface, it may help:)

Shugart Connector

Pin 2: Head Load

A low signal on this line sets the read/write head on the diskette. This feature is designed to protect the disk because the hear rubs on the disk only when it is actually going to access it. Unfortunately, this signal is not available of the ST becuase the WD1772 controller does not have this connection available. This line is often connected to 'Motor on' however.

Pin 3: Ground

All odd-numbered lines through 33 are tied to ground. This ground conection is used for operation as well as shielding.

Pin 4: In Use

This signal tells the drive that it is connected and is used. It is not available on the Atari.

Pin 6: Drive Select 3

A low level on this line means that drive three is being selected. Only the drive which is assigned as drive three by a wire jumper in the drive reacts to commands, and all other remain neutral. This signal is not used on the Atari because a maximum of two floppies can be connected (0 and 1, or A and B).

Pin 8: Index

The drive uses this line to send a low pulse upon each rotation of the disk. This signal tells the cotnroller that the data which follow are at the very start of the curent track. This can be used to sybchronise the controller.

Pin 10: Drive Select 0

This signal corresponds to the one on Pin 6, except that i concerns drive 0 (drive A).

Pin 12: Drive Select 1

As above, except for drive 2 (Drive A).

Pin 14: Drive Select 2

As above, except for drive 2. Not connected on the St because only two drives are possible.

Pin 16: Motor on

A high level on this connection starts the motor of all drives and a low stops them.

Pin 18: Direction

This signal indicates the direction of the next step of the read/write head. If this pin is zero, the direction is in, toward track 79, while a 1 means out, toward track 0.

Pin 20: Step

A low pulse causes the step motor in the drive to move the read/write head one step in direction specified.

Pin 22: Write Data

This line carries the serial data which are to be written to the disk.

Pin 24: Write Gate

This signal selects the data direction. If it is low, the disk is written, while a high signal indecates read. I fthe disk is write protected, no write access is allowed by the drive.

Pin 26: Track 0

If the read/write head is over track 0, this pin is low.

Pin 28: Write Protect

A low on this line means that the diskette is write-protected.

Pin 30: Read Data

The data read from the disk are sent to the computer via this line.

Pin 32: Side Select

This line selects the desired side of the disk. A low level selects side 1 and a high selects sid 0. This line is unused for single sided drives.

Pin 34: Ready

A low level on this line indicates that a disk is inserted in the drive and that it is rotating normally. The computer can use this line to determine if the disk has been changed. This line is not connected to the Atari ST.

All of these signals are TTL-compatible, meaning that 0-0.4 volts indicates a LO(zero) and a 2.5-5.25 volts means HI(one).

Atari ST	Line	Shugart Connector
1	Read Data	30
2	Side 0 Select	32
3	Ground	All odd lines
4	Index Pusle	8
5	Drive 0 select	10
6	Drive 1 select	12
7	Ground	See above
8	Motor on	16
9	Direction in	18
10	Step	20
11	Write data	22
12	Write gate	24
13	Track 00	26
14	Write protect	28

I have checked my external drives and they have drive 0 and 1 lines switched over, this enables you to use drive 0's as a drive B. Of course you can always change the jumper on the drive;)

```

I am using an Iomega Jaz drive (SCSI - 1 gig) with a Mega 4 ST, Toplink, HD driver and TOS 2.06. I am using the drive to store digital audio with Digidesigns Sound Designer soft and hardware,
The Jaz drive has a "sleep" function which turns off the drive motor if the drive is not accessed for 15 mins and the drive will not power up again when accessed unless I turn it off and then on again.

Does anybody know how to turn off this "sleep" function or of any software that allows me to extend the default 15 mins setting?
Iomega supply software to do this for PC and Mac but offer no support at all to Atari.
I'd be grateful for any suggestions at all.

The ZIPCTRL.CPX which has been included in the HDDRIVER distribution for quite some time now supports this. You probably need an update of HDDRIVER. The current version is 7.72.

Steve,
HDDRIVER7.xx (latest version) has such a function. Whether it works or not, I can't say since I'm having trouble now (after a trouble free year) with the 1 gig JAZ and IOMEGA refuses to check it out since I'm running a Falcon and not a PC or MAC!!! (pisses me off). However, good luck anyway.

What was supposed to be available? As the Eclipse isn't officially
released yet (should be any day now) the desTTiny can't be either.

I would like to uograde my Atari 1040 ST with another disc drive (B) with 1.44Mb HD. Is this possible?

2. How to get a proper signal from Atari video output to connect to RCA (cinch) on TV and to see colour? Any tips, cables schematics?

3. How to repair the keys that would not to work anymore? Can I connect the PC keyboard to my Atari?

4. Why my monitor often beeps(about 10kHz) when I turn him on?

Thank you for any help.

Yes it's in the Quick FAQ

> 2. How to get a proper signal from Atari video output to connect to RCA
> (cinch) on TV and to see colour? Any tips, cables schematics?

Using the RCA RF Modulator output should be straightforward. Just connect the other end of the cable to the TV's antenna socket. Some TVs need to be tuned.

If you don't have an RF Modulator in your ST, then it can only output RGB. Therefore, your TV has to have a SCART RGB input.

It sounds like you are only getting a black and white signal. Are you sure you are using the correct TV standard (PAL/SECAM/NTSC). Using a PAL system on a SECAM TV gives the same symptoms.

> 3. How to repair the keys that would not to work anymore? Can I connect
> the PC keyboard to my Atari?

Yes, but you need to buy an adapter. No home made solution I'm afraid.

You can also get a cheap old 520ST for those parts that die frequently:
disk drive, PSU, keyboard, mouse, etc...

> 4. Why my monitor often beeps(about 10kHz) when I turn him on?

Ouch... Maybe because it's coming to an end.

Yes, needs a 1.44 HD disk drive and a "hd module" for inside your 1040.
Some one around here, also some homebrewed modifications.

> 2. How to get a proper signal from Atari video output to connect to RCA
> (cinch) on TV and to see colour? Any tips, cables schematics?

With RCA, that�s a simple video signal, not all machines supports
composit video. Best way is scart. Colorised schematics of all kind of
vieo connections -> DOIT_ST

> 3. How to repair the keys that would not to work anymore? Can I connect
> the PC keyboard to my Atari?

Bad job. Many scews, many more rubber cups inside..

If you lost somethink, kick the keyboard. I think the cheaper and faster
way is to get another keyboard form fleamarked or some else..
Best electronics, other users..

PC keyboad needs a special keyboard interface..

> 4. Why my monitor often beeps(about 10kHz) when I turn him on?

Sorry, i don�t know. Must be a problem of the display.

Regards, Robert

Where? If I understand well, there are only instructions on how to *replace*
A: disk (of 720kb, which is in ST already), but I am asking will a new B:
drive of 1440kb work on Atari if I plug him on the back connector for
another disc drive.

then it can only output
> RGB. Therefore, your TV has to have a SCART RGB input.

It doesn't. But it have 1 audio and 1 video cinch input.

> It sounds like you are only getting a black and white signal.

I am not getting anything yet, because I didnt make a cable. I dont know how to connect it. I know what to do with audio, but video is my problem. I think that on composite video(pin 2) I would have the luminance, but I am talking about CVRS (luminance+ crominance) and I dont know how to mix that colours. I dont know what to do with VSYNC and HSYNC either. Maybe if someone could point me to some technical link about television signals.

Are you
> sure you are using the correct TV standard (PAL/SECAM/NTSC). Using a PAL

My TV is PAL. My ATari is from Germany. It has German TOS.

>

That's just what I ment. The date for the Eclipse and Tempest keeps slipping, just like the deliverly of the A/B's.
I would be interested in hearing from the tenth person to sucessfully purchase one (beta testers excluded) and report back on software compatibility, installation, and various Falcon motherboard compatibility issues with REV G/H and K machines. How does Apex Media run under PPC emulation? How does Cubase Audio run under PPC emulation? If those two applications don't work, why not just purchase a Milan? Sorry, but a PPC running 68K emulation at the speeds advertised just doesn't turn me on for the price they want. An Amiga PPC card can be had for 1/2 the price (god knows why you would want to do that either:0).
Hey, i'm a hard core Falcon user, but the "BIG" hype of networking cards isn't all that big of deal for us "older" users that don't have our accounts at school where a T-1 is available, and in the U.S., anyway, homes, apartments and motels don't have that kind of access either.
My NOVA is fast enough. My A/B 060 will be fast enough. I expect no retoric from one who thinks an A/B without a Nemesis is fast enough.

And you, dogging on another user (R.A.)in the newsgroup for talking about software he is beta testing that isn't available to anyone else. Shame on you, you Apex Alpha and Core Design advocate....

Where is Apex Alpha by the way? If there were beta versions that actually worked, and the project is discontinued, why not just release the betas into PD? It would go a long way to smooth over the bad rep that Titan has gotten over the "lost" Apex Media disk that so many users have complained about......

Mike

>Can you use a standard serial mouse with this computer?

Hi

You can use a standard PC serial mouse if you can plug it into your serial port, you will need a program called GEMmouse and possibly a db9 to db25 gender changer.

Someone has also made an add-on that allows use of pc rodents. I can't remember his surname, this is going bother me until I remember it:(
Anyway it's Mario ?????

The AHDI (HDX) software might have problems, you should simply check this. HDDRIVER and its tools will work in any case and also support special ZIP features. The demo version can be downloaded from http://acp5.chemie.uni-kl.de/seimet/atari_english.html.

I've heard that it does, but the disks won't be DOS compatible, so useless for transferring files over to or from a PC.

No, not directly on the ST's mouse connector.
Yes, on the serial port with the mouse25 driver, but then no modem.
Yes, on the mouse connector with the adapter from Mario Becroft.

This is in the Quick FAQ

Bonjour,

Dans son message ��Calamus 93 under Magic 6.0��, Fokko Veegens a �crit�:
��I have a problem using Calamus 93 under Magic 6.0.
��(yes I know I should upgrade, but I also use Calamus
��95 and 98)

If you have 95 & 98, why don't you use them instead of 93 ?

��The text editor doesn't work. I've heard about
��this problem, but people say I have to make a
��dual boot. Does anyone know how to?

I know there are some keyboard problems that can be corrected with CALAPATOS. You could also try with Eddie (you must have one with the SL98)

Yes, MagiC PC 6 and newer can access more than one serial ports thanks
to a device driver (modem2.dev). It tries to be RSVF compatible and
seems it succeeds with several utilities (and I-Connect) but unfortunately
STinG can't use it (probably due to the way serial.stx accesses the
serial ports). At least this was my experience with it, others may have
better results.

Hi Guys!

Yes, my SCSI Zip is fine in my chain. To get it to boot when it's the only device on the bus, you need an extra cable running to the joystick port to be able to get the termination power (on an ST, a Falcon has SCSI 2, which negates this AFAIK). If as most people do, you have other devices such as hard drives, then you don't need the cable.

Gary, you won't need a terminator if the Zip is last in the chain, as there is a switch on the back to enable or disable internal termination.

Another tip I can give, is to always use the drive standing on it's side, as I've found I get errors creeping in when the drive is flat.

Also it's not worth getting the parallel port version, as Atari's parallel port does not have all the lines needed for this to work, so it's SCSI only, but the SCSI version is much faster anyway.

Cheers!

James

John,

I thought about using an old adaptor I had for using the old PC card edge floppy cable on an IDC-equipped drive, but the flex cable in the Atari only has 14 conductors, and on one side of the cable, so I'm betting I can't just do a straight forward adaptor (though I bought a 3" female 34 lead card edge to female 34 lead card edge cable, just in case, but I'm afraid to try).

Dont know if this is the right place to ask but here goes!

Father in law has an old Atari 520st and has just picked up a second hand
Lexmark 10-20 inkjet colour printer. Does anybody know where we can get a
driver for this printer to suit the atari? Will this computer and printer
combo actually work ? Any info would be appreciated. Computer and printer
are Australian versions.

Thanks for your help

4 times slower as the scsi version..
But you can us it with an rom port interface from woller
berlin/germany

Regards, Robert

I recently acquired an Atari 1040 ST. this is the first atari I've messed with but am already impressed with this little machine ;-) anyway, this has a port for an external Hard-drive, but I don't have one... I figured there had to be something out there on getting a hard-drive, be it IDE or SCSI, to work with it.. I've found a couple of hardware solutions, both commercial. I've been unable to find schematics for any home-brew solutions at all, and thought I'd check here. At the very least I was looking for the info on ACSI vs. SCSI... anyway, any help would be apreciated...

The SCSI solution is the way to go. ACSI is very close to SCSI.

We have gone over this problem of DIY adapters many times now and, I'm
afraid, there is no easy way. Your best bet is to watch out for people
selling bare adapters (ICD, Supra etc.) when you can easily add the
remaining bits. Or, you may find offers of 'shoe-boxes' containing adapter,
PSU and drive.

I have 4 x 4Mb 30pin N/P Simms
now iam not sure if I can put them into a Atari STE
Now I took them out of a 486 Dx266Mhz that I had and I am going to
get an Atari 520 STE I know there are Simms Slots but I didn't know
if they will work.

please help

They look identical to the Falcon's internal Epson drive as
they have the same front but they are only Double Density.

Instead of beige the front is a charcoal colour. They're
almost as new.

All tested.

I have five up for sale or swop.

Price each is �10 including insured postage.

Always consider swops.

Also I still have a few spare Floptical disks. �3.50 each or
5 for �15.

Lastly a plain 520STFM with joysticks and lots of games plus
colour monitor �65 including postage.

Amiga 500 1MEG plus colour monitor, printer, slow modem and
lots of games �100 inclusive.

Again always consider swops.

I just acquired a Mega ST2.
Of course there was no software with it.
Can anyone tell me how to copy any of the available
utilities to an Atari formatted diskette using
DOS or Linux?

You need to have a look at the Quick FAQ.

An external SCSI HD will require a SCSI host adapter interface that connects to the ACSI port. There are no home brew solutions for this, because it is not an easily made adapter. It requires logic programming, PALs GALs and stuff.

Link interfaces can be bought from just about any of the remaining dealers.

There are no "universal" drivers on the Atari. Each application has it's own drivers.

Which application will he be using to print on the Lexmark ? He might have to invest in a copy of NVDI, a screen accelerator and printing utility, which will allow access to more modern printers as long as the application makes use of NVDI.

> Computer and printer are Australian versions.

Oh, so you might need to put them upside down then... ;-)

Read the Quick FAQ.

Just use a 720K double density DOS formatted floppy disk.

Yep;)

Format a double density disk, not a high density (HD) one, using DOS or Windoze and you will be able to transfer files easily.

I think the dos command is: format a: /f:720

It's a long time since I've formatted a disk using dos!

If the files are larger than a disk can cope with, then use a program to split the file up; I can't remember the program I used to use! now that's going to bug me all day;)

If you have a null modem cable you can transfer files using comms. software on both machines. There is also Ghost link, I've not been able to get this working on my Pentium machines!! It worked fine on my 486 though!

There are several program that allow you to format a MS-DOS compatible disk on the Atari. My favourite is DC format v3.

It is possible to use an extended format with the pc, you willhave to format using a program for the Atari to use it. You can format, e.g. 10 spt, 81 tracks etc., and then use DC format to put a MS-DOS data on it! Ideal for those medium size files.

```

Hi there,

J.W. Krych wrote:

>
> I know that the Falcon030 doesn't seem to like certain IDE drives.
>
> Will a 320Mbyte Seagate IDE, brand new, pose a problem for me?

I haven't heard of any older Seagates (Conners) causing problems. I had a Conner (which is also a Seagate) that worked fine (340MByte).

I am curious how a 320MByte drive is brand new!? Most new 2.5" IDE disks are in the region of 3.2 GBytes minimum capacity these days!!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

That's why it's important to trace the pins one by one to be sure they
go to the right place.

Many Lexmark injets are Hewlett Packard PCL compatible, and some Atari
programs have HP drivers. You may get somewhere with this approach.

computer fairs are awash with small old stock  but nevertheless brand new
drives,while of no use to many PC users these are a bargain for  Atari
users ,I picked up an 850 for 10 pounds

I just picked up a second TT and it has a problem with its ROMS. When booting it does not who the memory check or the Atari Fuji Logo but, after a little bit it boots up. Its like its checking the memory but, you just cant see the bar showing progress.

So I removed the ROMS out of my other TT and the second TTs problems went away. With the second TTs roms in my original TT the same problem happened as it did in the second TT.(Wheh hope tha makes since :))

The jumper settings according to the TT service manual were correct and the same for both setts of ROMS. BTW, its TOS 3.06. The chip numbers are 27C101A on the original TT and D27C101 on the second TT. Here is the other numbers found on the ROMS

Original

C301925-005
EE $BD53

C301926-005
OE $B6B8

C301927-005
EO $A97F

C301928-005
OO $73DD

SECOND TT

C301925-004D
EE $9235

C301926-004D
OE $A686

C301927-004D
EO $B299

C301928-004D
OO $1A7A

Can anyone please tell what the difference is between the chips?

And any other info that may help with the chips.

Don

> users ,I picked up an 850 for 10 pounds

10 pounds is pretty good! Rip-off artists here in New Zealand are asking
(quick mental conversion of NZD to UKP...) 20 or 30 pounds for 2nd hand
disks of < 1GB capacity sometimes. You simply DO NOT SEE any new disks
that cannot be used in the latest Win98 machine, as I think the PC shops
here return them to the manufacturer if they become 'too small' for use
in a PC...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

The SLM804 connects to the ACSI port. I've never had one, so I can't
tell you much more.

Drivers will depend on the application you plan to use.

hi,
 I've been trading this question around looking for someone who
can tell me if this is possible. I just want to successfully transfer
those fun Automation games to my ST from the dreaded PC.
I know Null modem cables have been hooked to Amigas and PCs
and operated successfully, so how about the ST?
 Anybody done this out there, as I haven't had too much success with
Makedisk and STdisk.
 thanks,
jim

:   I just picked up a second TT and it has a problem with its ROMS. When
: booting it does not who the memory check or the Atari Fuji Logo but,
: after a little bit it boots up. Its like its checking the memory but,
: you just cant see the bar showing progress.
[snip]
: And any other info that may help with the chips.

It sounds like the TOS version from your second TT is an early revision
of TOS 3. I have 3.01 in my TT, and it doesn't do a memory check or
display a fuji. Try booting with a floppy in the floppy drive,
and your bootup should be a lot faster. TOS 3.01, at least, seems to
check the floppy drive for 90 seconds before it gives up when it doesn't
find one and boots from the hard drive. Use NoRoach to cut the delay time
to something reasonable.

First of all, this is software piracy. There is no such legal notion as 'abandonware' or whatever. Even if you have the feeling that this causes no harm to anyone (which is wrong), this is illegal.

> I know Null modem cables have been hooked to Amigas and PCs
> and operated successfully, so how about the ST?

No problem at all.

You can use ghostlink to connect both machines, which will make the PC drives appear as icons on the ST's desktop.

The problem is, memory-wise where are you going to put >800K disk image on the ST side. Do you have a hard drive ? Do you have more than 1Mb to use as a ram disk (you'll need to fit a 900K ram disk, plus whatever program you are going to use to convert the image)? Do you have a second floppy drive ?

If this is on a bare-bones 520ST, then it's a lost battle.

Why not convert them to MSA (which is like the .ST format, but with compression). These should fit on a 720K disk. There are utilities in the emulation world that can convert .ST files to MSA and vice-versa.

Nick

I have no idea about the hardware setup needed (if any).

>Any hint about using one with MiNTnet?

Nope, except that I've seen a rumour that it should be possible.
So why am I replying to this at all then, you may ask.

Well, I just remembered that a Riebl card was exactly what Peter
Rottengatter used, and for which he wrote the ETHER.STX which is
part of the STinG 1.20 distribution package...

So for STinG, this card should be more or less 'plug-n-play' :-)
(Except for possible hardware strap needs.) And if there is any
problem, we do have access to the full source code as well, as
this was sent out to the beta list quite some time ago.

I now it may be useless to even mention this to the NMD developer,
but you could try it at least, as there is no conflict in using
MiNT and STinG 'side-by-side' as long as they use separate ports.

In fact it should even be possible to write a combo of STX and XDD

files that act as a local gateway from STinG to MintNet and vice versa,
though I know far too little about XDD construction to do that job.
(It is certainly possible at the STinG end though.)

>you just cant see the bar showing progress.

I see, just like TOS 2.05 on an MSTe then ?
Or could the delay be simply because it is trying to read a floppy ?
I know my TT boots a bit slower if no floppy is inserted.

The floppy contents makes no difference. Any floppy disk
at all will speed things up (unless directory is crashed).
Try with a floppy disk, to see if it makes any difference.

Also try pressing a key (as with TOS 3.06), to see if it then stops
the delay, as this should break a memory test if that is what it is
doing during the delay.

> So I removed the ROMS out of my other TT and the second TTs problems

>went away. With the second TTs roms in my original TT the same problem
>happened as it did in the second TT.(Wheh hope tha makes since :))

Consistency is always good, even with errors...
They raise the hope of a consistent cure.

>The jumper settings according to the TT service manual were correct and
>the same for both setts of ROMS.

They should be as the EPROM types mentioned below are virtually identical.

>BTW, its TOS 3.06.

For your original TT I'll believe that, but not for the second one.
If no fuji logo is shown, then it must be some older TOS.

>The chip numbers
>are 27C101A on the original TT and D27C101 on the second TT.

That just gives the EPROM types, saying nothing of the contents.

>Here is the other numbers found on the ROMS

These are the ones defined by Atari to specify the contents.

>EO $B299
>
>C301928-004D
>OO $1A7A
>
>Can anyone please tell what the difference is between the chips?

Yes. Those of the second TT are from an older TOS version.
Possibly this was TOS 3.05, but I am not sure, as I do not know
in what version the Fuji logo was introduced, nor am I sure of
how to interpret the suffix codes shown above, except that
-004D is definitely older than -005, but not by very much.

>And any other info that may help with the chips.

I don't think you really need any. There is probably nothing wrong
with the TOS except that it is an older version. Anyone with an EPROM
programmer and an EPROM eraser can erase the old contents and refill
the chips with TOS 3.06, thus making your two systems identical.

Even lacking that update, I still think the second TT will work.

You're not the first one to think of this ;-) I have been thinking of writing packet-drivers for STiNG and MiNT-net (XIF, not XDD) that use a block of shared memory to exchange packets, mostly to be able to use STiNG's IP-masquerading. However, with the recent development of IP-masq. in MiNT-Net I no longer have any need for this.

As for the Riebl-card, there are drivers for it (inc. source) in the MiNT-Net distribtion, so it shouldn't be hard to set it up. The problem is (as M-E indicated) the Riebl's hardware-address which might be lost. I'm afraid I can't be of any assistance in this case, as I don't have a Riebl myself.

I assume you received the SLM interface with it. After connecting everything, you have to install the appropriate drivers in your software. Some programs will address it through NVDI. Others use the Diablo driver shipped with the printer. Others use the GDOS drivers shipped with the printer.

Yeah, I had a mental block and didn't catch what you were saying the first time. I traced the external connector on a regular external drive to the IDC connector inside to get the right lines. I'm surprised to find that there are two pins unused. I guess the 14 pin connector must have been cheaper than the 12. Not like the Tramiels to waste a penny.

They should work. None of the ST machines required parity and the SIMMs need
to be 120 ns or faster.

I just inherited a 1040ST and a Navarone real time clock. I put the cartridge in my current ST but the auto-folder program doesn't work with it. It doesn't update the system clock from the cartridge.

It workes in the machine it came with and the only obvious difference is that it has TOS 1.0 and my current ST has TOS 1.4. Is this a known problem? Is there an updated program (tkauto.prg, I think it's called)? Is the company still around? I couldn't find them on the net. Thanks in advance for all comments.

I'm afraid you're in a completely different situation with an STF. The
STF does not take SIMMs.

This is all explained in the Quick FAQ.

Nick

Thanks to Leo for the NetBSD Faq, it cleared up a few things, not
just about the Riebl, but also about SCSI termination and a few

more things.

Ronald, we already have GlueSTiK that patches STiK calls into MiNTnet,
but indeed a low-level interface might be even better. The problem
is, STinG is currently known not to work on AES 4.1 and MiNT.

Jo-Even, yep, got the MiNTnet drivers, but the instructions are
rather vague. I'll see what Torsten has to reply.... ;-)

Hello All,
I have an Atari Jaguar+CD system for sale. The system includes to controllers,
about 12 games, and the Atari Jaguar Gamer's Guide (I don't remember the exact
title). I will entertain all reasonable offers.
If you are interested, you may email me at angief18@aol.com.
Thanks,
Sam Ferrer

There are other useful reasons to do it too, but that is also a matter of taste (in clients etc). Whatever the reasons, compatibility never hurts anything.

>However, with the recent development of IP-masq. in MiNT-Net I no longer
>have any need for this.

Yes, I know. Mario and I had some nice Email chats about how best to fix this limitation of MintNet. He could have done it anyway of course, but I like to think that my help shortened his labor a bit.

some time ago i send the info to Chips n chips (M.Ruge)

maybe you can find it there but here is my info  as I see it from my
Riebl card in a TT

J1-6
all together: BNC or AUI corrsponding position to the plugs of both

J7 to top BNC other AUI
Some say: no jumper

J17-23
closed all=TT open all=megaSTE

J8-J10
unknown works if
closed/open/closed in TT

Met vriendelijke groet,

```

Somebody told me that you can configure HSMODEM so that if you select 300 baud that you can actually use 38400 baud. Does someone know how to do this? The reason I'm asking is that I would like to use the Remote (mini-BBS) mode of STalker to link my TT to my Mega STe to transfer files. STalker only allows connections between 300 - 19200 baud. I would like to have a faster link, and 38400 would be a big improvement.

I tried the next higher connection (57600?) linking Serial 2 on both TT and Mega STe, but it did not seem to work (I could not see the characters I was typing appear at the other computer while running STalker at both machines with the same baud rate and communication port).

Can somebody suggest a good way to link the two computers together? Right now I have two modem cables and a null-modem adapter and can link at 38400, but with the STalker remote only at 19200. Thanks.

I have a suspect 105mb internal hard drive in my mega ste.

Inside is fitted a hard disk controller board C103561-001 Rev.3

Socketed chips on this board are

1) C103706-001   SCSI #7026
2) C103705-002   ACSI #4F32

There are 3 dip switches - all in the on position

My questions are - what is the function of the dip switches and what kind of hard-drive is available as a replacement?

Thanks
Martin Holmes

The extra connector is a DMA through port to connect extra DMA devices in daisy chain so the printer will not terminate your daisy chain. The Diablo driver enables it to be a generic text printer. Some software uses the Diablo driver as a graphics printer. GDOS software sees it as a GDOS output device. Some software has specific SLM drivers built in.

Now you're on the right track. You'd have to ask someone who worked in engineering at the time as to why that decision was made....

If these switches are the same as in the Megafile, it should select the

Unit number. To check this, change a switch and observe the boot up messages as to the SCSI ID number. Any of the older SCSI drives should work in there.

For files transfer using NULL modem, see my webpage for how to do this.

Noted.

> J7 to top BNC other AUI
> Some say: no jumper

Mine only has 2/3 of the header strip, so it one can only put the
jumper to the "up" position.

There is also a J11 (between the power converter and the fuse);
same thing: 2/3 of the strip, towards the 7990 Lance chip.

> J17-23
> closed all=TT open all=megaSTE

Weird, mine came as:

J17-21 closed
J22-23 open

> J8-J10
> unknown works if
> closed/open/closed in TT

Noted.

Btw, most of the above was also found on the NetBSD FAQ. ;-)

It's important to have the laser switched on (if it's plugged in to the DMA port!) as otherwise you'll lose access to floppy or hard drives. It's possible to open the rear flap which will turn off the heater (saves electricity) but still leaves the controller box powered.

>Drivers will depend on the application you plan to use.

Luckily most Atari software has SLM drivers, including all versions of NVDI and GDOS.

There's also an Epson 9 pin emulator (!) on ftp sites (look for Laserbrain IIRC) and a Diablo 630 emulator.

I have an HP Laser/Deskjet to SLM driver that can also be used, one can also connect any other computer to the Atari and print to the laser using a null modem connection, look on my web page.

Hi There,

Finally I have connected a Mac and a TT030 with succes using the TT's LAN/Ser.2 port and the Mac's modem port. Using STinG I can send and recieve pings. So the connection works. But now I want to transfer files. I downloaded Aftp, but I think I have to use an ftp-server. Has anyone a better solution for this problem?
It's just to exchange files between the Mac and the Atari.

Thank You,

Fokko Veegens

Dip switches 2 and 3 on your host adapter are to change the SCSI ID
number as follows:

2	3	ID
ON	ON	0
ON	OFF	1
OFF	ON	2
OFF	OFF	3

Jumpers on your HD drive must be set to ID=0.

Dip switch 1 is set to ON at me but I don't know what is its
destination.

>to do this? The reason I'm asking is that I would like to use the Remote (mini-BBS) mode of STalker to link my TT to my Mega STe to transfer files. STalker only allows connections between 300 - 19200 baud. I would like to have a faster link, and 38400 would be a big improvement.

The special modes described for HSModem require a hardware patch too, so as to make an alternative clock source available. I have built one such, which was based on a GAL chip, and gave three new higher speeds.

These are 38400, 57600, and 115200. Using the top speeds does require an accelerated system. A 16MHz MSTe should be able to use 57600 well, but results with 115200 are more dubious. (I have no MSTe to try it.)

For old software the lowest speed settings can be used to choose the new speeds, but newer software can recognize their availability through HSModem, and can present the real speeds in their menus.

The project name for this patch is RSVE, and the person to contact is Harun Scheutzow, the author of HSModem.

There are also many other variations on alternative clocking, but RSVE is IMHO very good, and has excellent support through HSModem.

>I tried the next higher connection (57600?) linking Serial 2 on both TT and Mega STe, but it did not seem to work (I could not see the characters I was typing appear at the other computer while running STalker at both machines with the same baud rate and communication port).

I think MSTe and TT do not use exactly the same speeds, although some software (like STalker I think) can't tell the difference. But I have no MSTe myself, so I can't experiment with this.

>Can somebody suggest a good way to link the two computers together? Right now I have two modem cables and a null-modem adapter and can link at 38400, but with the STalker remote only at 19200. Thanks.

The easiest way to get a higher speed than 19200 is to use Midi instead. That too is a serial port, and it runs at 31250 bits per second. Midi is implemented identically on all Atari machines, so there are never any incompatibility problems.

For the software I recommend STinG (of course :-)

This is not the case, both BetaDOS and MetaXBS works fine with 1.15.1
here. How does your problem manifest itself?

> Perhaps I'm missing a point here, but where is the benefit in

None, and nobody is trying to do so either. Check your setup again.

The Linux 68k distribution has something to set that number when the battery is empty.
Best to do: new battery, install Linux, setID, install MinTnet.

But first check maybe the Id is still in there!

Anyone a better idee?

In this case no hardware patch is needed! To link the TT to MSTe at 57600 use Serial 2 on the TT and Modem 2 on the MSTe.

Stalker is not aware of the Modem 2 port speed differences between TT and MSTe and simply uses the TT speeds also on the MSTe. If you insist on using Stalker (Connect is freeware) it is possible to setup Hsmodem on the MSTe to make Stalker think it is using Modem 1 at 300 bps but the actual data is sent through Modem 2 at 57600.

What you will have to do is first in SCC.PRG set it to emulate Modem 1 through the Modem 2 port. Then enable the option to set the higher speeds by using the very low port speeds 50, 75 and 300 bps.

In Stalker set communication port to Modem 1 and speed to 50-75-300 bps. This will work good but you will get very high transfer procentages in the Stalker transfer window.

A not modified MSTe can use 57600 with only a very few lost characters.
If you can get a escc chip instead of the scc it is supposed to work
better. My TT runs perfectly at 57600 on Serial 2 but looses characters
as well at 115200. Maybe that's because I have no TT ram.

Does anyone know where you can get the Zilog escc chip?

This is correct. Se above!

>

If you want flexibility STinG running BNET will let you share drives
between computers. But for fastest possible transfer rates z-modem with
zipped files is best.

AFAIK, one doesn't need to have a battery at least not if one use the Mint
'98 installation kit. According to the manual the hardware address is set
everytime one boot. The AdMiNTool has somewhere an option where one can
fill in the address as found somewhere on the backside of the card.

I purchased a Riebl card a couple of months ago. It has an original
battery in the thing I am told (so it's gotta be dead!). I'm running
Linux. Once I got the card installed Linux recognized it upon boot fine.
I have the TT networked to another Linux box and it's working fine with
the original battery.

Good, then the rest should not be hard to do.

>But now I want to transfer files. I downloaded Aftp, but I think
>I have to use an ftp-server.

That should certainly work, and if you can't find one for the Mac,
you can find one for STinG in the "STinG"/"File" submenu of my
homepage at the URL given in my SIG, at the bootom of this post.
Look for "FTP Server" by Vassili Papathanassiou

With that installed you can then do the transfers by using an
FTP client on the Mac.

>Has anyone a better solution for this problem?
>It's just to exchange files between the Mac and the Atari.

If you run MagicMac on the Mac, I think you should be able to use
STinG at both ends (if you can configure Mac to release the port).
Then you can install the BNet Server/Client and get access to all
of the drives on each machine from the other machine. BNet is
also available on my site, and was also written by Vassili.

I've never tried that, as I have no Mac, but if MagicMac is as capable
as it should be, then this should work. Similar stuff works with
Magic-PC, as reported by some people.

Note that of these two methods the FTP one is likely to be a bit
faster, but the BNet method is very convenient, as all transfers
can be made as normal copy operations by drag&drop in normal
desktop directory windows.

Then again, the FTP method is *sure* to work, whereas the BNet
method depends on characteristics of MagicMac, which AFAIK
have never been fully tested.

>> (And thus also to my BetaDOS) Good work... NOT.
>
>This is not the case, both BetaDOS and MetaXBS works fine with 1.15.1
>here.

In your private mail to me on the same subject you also told me that you are also using the SPIN.XFS, which is of course required for your tests of MetaXBS, as that one only loads BOS drivers, but no DOS drivers. The DOS drivers are instead loaded by SPIN.XFS when MiNT starts.

Then when you access a CD-ROM drive from the desktop, this gemdos call is translated by MiNT kernel into a call to the SPIN XFS driver, and that in turn calls XBIOS which reaches the XBIOS dispatcher of MetaXBS which in turn calls the loaded BOS drivers.

Thus the necessary chain of DOS and BOS functions are invoked without passing the call down to any other gemdos layer below MiNT.

Now then, when you boot BetaDOS instead of MetaXBS, then BetaDOS does load both BOS and DOS drivers, but then the boot proceeds as above, with SPIN.XFS also loading the same DOS drivers for the same drives.

This means that SPIN will hide the fact that no calls are ever made to the gemdos dispatcher of BetaDOS, by performing the same actions as described above when using MetaXBS. And in fact that is correct by MiNT in this particular case, as the drive is handled by an XFS.

The real problem will only be visible when you try MetaDOS or BetaDOS without SPIN.XFS, as it is only then that you are actually testing if MiNT can reach the MetaDOS/BetaDOS gemdos dispatcher.

But now I am sure someone will say that if SPIN.XFS can do these things, why not let it do so then for all BetaDOS drives ?

The problem with that is that this only allows the specific DOS drivers supported internally by SPIN.XFS to function. All other ones will fail, even some supported by normal MetaDOS. Also, the DOS drivers that SPIN supports are only CD-ROM drivers, that must use a CD-ROM BOS driver.

BetaDOS supports many other drivers, such as ExtenDOS drivers, which are not compatible to MetaDOS and therefore not to SPIN either. And BetaDOS also supports drivers that are not for CD-ROMs and do not use any BOS, and that is done in a special way which allows drivers not possible under MetaDOS. So there are many useful drivers that SPIN can't support.

None of these drivers can be used under FreeMiNT 1.15.1, because the MiNT kernel does refuse to call the underlying gemdos layer as I described.

>How does your problem manifest itself?

eg: I boot with MINT030.PRG version 1.15.0 copied to \AUTO\MINTNP.PRG . When I reach desktop I test access to various BetaDOS drives, and they all work, both directly and through U: links

I then copy MINT030.PRG version 1.15.1 to \AUTO\MINTNP.PRG and make a new cold boot, just as the last one. When I then reach desktop and test exactly as before all access fails, both directly and through U: links. Those links are still there, showing that BetaDOS has installed its drivers as usual. But access fails because MiNT never calls any GEMDOS dispatcher below itself even for drives that it has not itself loaded any drivers for. It is crystal clear.

>> Perhaps I'm missing a point here, but where is the benefit in
>> blocking compatibilities ?
>
>None, and nobody is trying to do so either. Check your setup again.

I didn't really mean that someone was *actively* trying to do so, but I did mean to emphasize that the entire issue is being ignored, and is never tested properly before MiNT is released. Had it been so tested then this error would have been found long before release.

Kenneth, I have no argument with what you say about the Serial 2 and Modem 2 ports. Of course no patch or other strangeness is needed to get high speeds on those ports. All that is needed is proper software.

But his mention of using the low speeds to select a high speed made me think he meant the Modem 1 port, which when enhanced by RSVE or some other patches does get exactly that characteristic. The very lowest speeds, that are not useful anyway, are detected by the hardware and the resulting signals are used to choose one of the three newer speeds, all faster than the old 19200 limit of Modem 1. The same thing can be done for serial 1 of course, but is less useful as there are no handshaking lines for it.

The nice thing about the RSVE is that it works on all machines that have a normal Modem 1 port, so even an ST or STe can get a real high-speed port, though they will need an accelerator to use higher speeds than 38400. (Which does work reasonably well.)

Evidently I misunderstood him, as there is also the 'low speed setting' trick of HSModem itself, for cases with 'improper' old software. I have somehow missed that trick, as I was never interested in using any software that needed it.

Hello all,

My MegaSte 4/100 is dead (;_;). (black vertical stripes on white screen at boot-up)

I wonder if I can use :
the internal 105Meg Hard disk
the 1.44 floppy drive
the 4 meg RAM

on my newly acquired TT 2/40 ?
I'm pretty confident that exchanging hard drives would work, am I right ?
what about the HD floppy and RAM ?

Greg.

Hi,
I am trying to add new fonts into the BTFONTS folder to use
with Papyrus4 with NVDI 4
I copy relevant font files from Bitstream 500 font
CD into BTFONTS folder, select scan them in the NVDI font
cache CPX
I reboot

message comes up "font files damaged"

can anyone help?

thanks,
Clem.

That's for connecting a hard disk interface to (Link, Link II or Link '97) so that you can use a hard drive with it. Without the laser's controller you'd plug the hd interface into the back of the ST, where you have the laser at the moment.

>Can this be used as a general printer or is it only addressable from
>specific software?
As I said you will need either the Laserbrain or Diablo 630 emulators to use it as a "general" printer.

Don't expect to be able to find new drums or toner very easily BTW.

Don't junk it yet, sounds like a memory problem, or a loose connection.
I'm not too familiar with the insides of the MSte, but the symptom you
describe happened a few times on my STFM, & was usually a loose connection or
bad soldered joint.

Might be a defective chip.

Can you get it fixed?
It's always better to have two working Atari's.

I have found out today that even though the book says it does (and the web site), Gemulator does not yet support TT Tos 3.06.
The other problem is that it does not support 28 pin 2 chip roms such as my TOS 1.62 roms
I am getting Tos 2.06 32 pin roms hopefully tomorrow.
MagiC6 ,NVDI 5 and CAB 2.7 arrived today so I will let you know how it all works out.

I have had this trouble with some fonts. I just turned off the font checking in NVDI and everything was OK. There can't have been MUCH wrong with the fonts :-)

You're running BetaDOS /before/ MiNT, right? I know this is the correct to do so for MetaDOS, as this can't cope with multitasking GEMDOS where there's more than one current drive and directory, but if BetaDOS doesn't suffer this restriction, try running it after MiNT.

Reason for this is that in the long run, MiNT will completely replace GEMDOS, and that will also mean filesystems not explicitly supported will no longer be accessible, as the original GEMDOS is simply switched off.

> None of these drivers can be used under FreeMiNT 1.15.1, because the MiNT
> kernel does refuse to call the underlying gemdos layer as I described.

As said, only when it's run before MiNT. If BetaDOS can't cope with being run with MiNT being active, that should be changed.

Ciao

Thomas

Can anone help wityh setting up a flat bed scanner on a Atari Mega STE. It is a Cannon Scanner with SCSI interface. I use a ICD board access by SCSI harddrives and would like to daisy chain the scanner? Also where can I find software for a scanner that a twain compatable? Any help on this topic would be greatly appreciated.

The hard-drive and HD floppy should work, but ensure that
the TT has the Ajax chip as a floppy controller first.

RAM will not, because it is completely different on the TT.

I was having this effect usually after some hours of work.
I susspected RAM SIMMs but finaly the problem disappeared when I changed
the flat cable connecting SCSI HDD with a host adapter.

I've an unaccelerated STE with a serial port upgrade based on the CD4040 chip giving me both 57600 and 38400 bps. What I've found is that under plain TOS using 38400bps I get some lost characters while 57600bps is almost unusable. Using the same STE with Magic 5 results in 38400bps being no different to 19200 and, when using a comms program that turns off the mouse interrupt, 57600bps has no lost characters.

I did try using 57600bps with STing but it was slower than using 38400bps. The strange thing about that was there was the same number of packets that were dropped with both of the faster speeds but the cps rates reported by STing was ~1000cps lower for the faster speed. I'm guessing that this is because of the extra processing required handling the packet headers. With a faster processor, it would probably end up that 57600bps could become faster than 38400bps.

I suffered acute memory loss and stack overflow.

For sure with the admin tools you can set the number.
But (maybe because I use Cab 1.5) I cannot do that. The form on
the screen gives not enough places to type in that long number.

But no problemo: my card has a good battery that keeps the internal
number.

Hello,

Martin Graiter wrote:

>
> Are there any SCSI to Ethernet adapter drivers for the Atari yet?
> There were some rumors about this, but nothing finally emerged?

The problem was, and still is, that we can't get the technical documentation for these adaptors. The producers don't want to give them. And since nobody wants to start without the technical documentation not much is happening.
Although, a Dutch guy is making such an adaptor from scratch. Software drivers will also be available.
Another positive thing : if you really want an ethernet connection for your atari, you can consider a parallell port adaptor. In here and a few weeks STinG driver software will be available, together with some extra hardware plans needed for connecting the adaptor with the ROM-port.

I can only suggest you to take a look at this page :

http://gallery.uunet.be/saka/atari/network/index.htm

Hope this helps,

Greets,

>You're running BetaDOS /before/ MiNT, right?

Normally yes. There are *very* important reasons to do so.

>I know this is the correct to do so for MetaDOS, as this can't cope with
>multitasking GEMDOS where there's more than one current drive and directory,

What you say is an oversimplification of the problem. The real case is that each APP can have its own 'current' path for each existing drive. That means up to 26 'current' paths per APP. (Assuming only normal GEMDOS drives A-Z) And the number of APPs can of course be quite large.

Dealing with that would require reimplementing all of MiNT's path handling inside MetaDOS/BetaDOS, or at least finding a secure way of finding where and how MiNT stores those paths. And that is not known to me. I only know how to find the current drives for each APP, but not the path strings, so for BetaDOS (and also for MetaDOS) the 'current' path of a drive is global.

That is why it is so important even for BetaDOS that the Dsetpath and Dgetpath functions of MiNT are installed 'on top' of those of BetaDOS, so that the 'global' path treatment does not 'infect' any drives owned by MiNT or its XFS drivers. That would be intolerable incompatibility on my part if I allowed it to happen, and I will not do it.

There are also many other problems involved, such as GEMDOS reentrancy etc. MetaDOS would need heavy restructuring to deal with that as well. BetaDOS can deal fairly well with such things, as it is written to be reentrant in some important ways (that is what makes CLUSTER.DOS possible), but the path handling is another type of problem. I simply can't find those strings.

NB: Any information on how to find MiNT path strings would be very welcome.

>but if BetaDOS doesn't suffer this restriction, try running it after MiNT.

I thank you for the suggestion of a workaround of this kind, but I have already made test versions that allow booting after MiNT, and this has proven that with my present knowledge such an implementation can not be made sufficiently compatible with the path handling of MiNT.

>Reason for this is that in the long run, MiNT will completely replace
>GEMDOS, and that will also mean filesystems not explicitly supported
>will no longer be accessible, as the original GEMDOS is simply switched
>off.

I simply can't agree with that notion. GEMDOS always was and always will be the mainstay of the TOS platform, and if MiNT shall ever replace it entirely, it must do so by incorporating all of its facilities including support for GEMDOS extensions as defined by Atari, such as the MetaDOS interface.

MiNT will never completely replace GEMDOS, as MiNT isn't the only multitasker for the platform with a growing user group. Abandoning support of original

GEMDOS features, such as its extensibility (for example by a MetaDOS), will
only serve to alienate a large number of potential users. Those will then
choose another multitasker that does support the features they want.

>> None of these drivers can be used under FreeMiNT 1.15.1, because the MiNT
>> kernel does refuse to call the underlying gemdos layer as I described.
>
>As said, only when it's run before MiNT. If BetaDOS can't cope with
>being run with MiNT being active, that should be changed.

With the current state of MiNT documentation I find it impossible to change
that in a manner that would be compatible with MiNT's path handling. Doing
it in an incompatible manner is against my principles, even though that does
work for BetaDOS itself, so for the moment this means that BetaDOS can not
work with the FreeMiNT 1.15.1 kernel.

If someone can provide me with the information needed (see above), then I'll
use it to implement such a change. But I'll still consider the new behaviour
of FreeMiNT 1.15.1 to be incorrect. No driver should usurp operations which
are directed at other drives than those which that driver has been told to
handle.

That is to be expected. The system simply isn't fast enough to deal with a character stream at 57600. The slight number of lost characters at 38400 are no problem for error checking protocols such as TCP, so they only result in a few retransmitted packets, with no damage to final data. The same applies to other error checking protocols such as Zmodem.

>Using the same STE with Magic 5 results in 38400bps being no different to
>19200

That is because important parts of MagiC are written in hand-optimized assembler, which makes MagiC much faster than TOS. It is in fact the only multitasker for TOS machines that actually raises system speed.

>and, when using a comms program that turns
>off the mouse interrupt, 57600bps has no lost characters.

It may be enough under MagiC, but I doubt if it would do the same under normal TOS. It would have some effect, but not enough I fear.

>I did try using 57600bps with STing but it was slower than using
>38400bps. The strange thing about that was there was the same number of

That is probably due to a combination of effects based on the TCP window size and the timeslice delay. With frequent errors this limits the number of packets handled.

>but the cps rates reported by STing was ~1000cps lower for the faster speed.
>I'm guessing that this is because of the extra processing required handling
>the packet headers.

I rather think it was due to more and/or larger retransmission delays. TCP fluency is a rather complex subject.

>With a faster processor, it would probably end up
>that 57600bps could become faster than 38400bps.

Yes, that is definitely the case. This has been verified by many users.

On my systems I use 76800 between Falcon and TT, and 115200 between TT and my 56K modem. (To make efficient use of modem compression.)

```

Hi!

Having found that I can put a subject line in a mailto: link, does anyone know how to have spaces in the subject? Apparently it works from a PC, but doesn't work on an Atari when Newsie is the emailer.

```
<A HREF="mailto:jfhaslam@zetnet.co.uk?subject=This_is_the_subject">email me</A>
```

..works, but...

```
<A HREF="mailto:jfhaslam@zetnet.co.uk?subject=This is the subject">email me</A>
```

..doesn't! :(

Anyone know?

I forgot to add that someone told me that "%20" (percent two zero) should work in place of the spaces should work, but Newsie doesn't interpret them as spaces.

I've put a test page on the web with the options I've tried. Try it yourself, and then see if you can suggest a solution.

http://www.users.zetnet.co.uk/jfhaslam/test.htm

Cheers!

James

Hi James. I know he surely does hate MagiC. Hmm...is that official? That
the Milan will "dump" N.aes in favor of MagiCMilan? I hadn't heard that
anyplace else. I wonder why-I would have thought that they would have
just offered a choice to the buyer, like they do with so many other Milan
options...

Later... ;-)

Thanks for the info.
If needed, can I take the Ajax chip from th MSte and use it with the TT ?

sure, but there's no one around with Atari repairing skills. (I live in New
Caledonia and nobody
ever sold a St here)
Besides, my MSte did only accept to work when put in the freezer ....
I'll be happy enough if I can salvage my HD with the TT.

No, that is not possible on a TT. The TT only supports resolutions
that 'look' like ST resolutions, but the timing of the video signals
is that of VGA monitors, which is not acceptable to any television
sets that I ever heard of.

Hi Ronald

I�ve seen some expensive tellys that are VGA compatible. But it was sets with Dolby-sourrund and wide-screen and alot of other extras. So we are talking megabucks and big screens.

Cheers J�rgen

Hi Folks

Over the last few months, my Atari 520STFM has slowly been giving up. It's got 4Mb memory installed on a separate card (can't remember the name of it). The printer port gave up first, and now the serial port's gone too. I live in the UK.

I need a new motherboard.

I've got a few questions:-

What are the chances of me getting a straight replacement motherboard for a good price? And where from?

Is there a chance of me being able to "upgrade" my machine to an STE? Are the holes in the back of the plastic case in the same places, and are the screw holes all in the same places?

Thanks in advance.

James Davies

PS - I'm NOT expecting to be able to put a STE board into a STFM case.

first or all i don't know the pin out for the scart connector, you might find it at the maplin electronics web page www.maplin.co.uk it is in their (dead tree edition)catalougue (they will also sell you a 13pin conector for the monitor port on the atari) and secondly this may not be related to scart in any way but may be of some use to people wanting to connect a monitor of some description to thier atari.

what i can tell you is that it is important to get the syncs right
i bought a cheap rgb monitor a while ago and had to make a cuircuit to produce the correct signals

rgb monitors use composite sync, some ataris provide this (old 520stf without modulator) but most, come to think of it all the ones i have ever seen don't. (hence the "where aplicable" in the manual)
in this case you will have to make it yourself. do this by combining both vsync and hsync with an AND gate (or two NAND gates if you want)

the 74LS00 quad nand gate is a lovely chip which maplin will also sell
you which is perfect for the job.(cost less than �0.50)

connect it thus:

```
    vsync------1| \/ |14 +5v
        hsync- 2|    |13
connect     +--3|    |12
these3      +--4|    |11
together    +--5|    |10
composite out--6|    |9
         gnd---7|    |8
```

crap diagram i know but i'm sure you get the idea
gnd and +5v can be taken from any nearby 74 series chip or anywhere
else on the motherboard where you can find them.

personaly i prefer to house the cuircuit in the monitor but you could
put it in the st and connect it to the monitor connector where it was
suposed to be.

this may not be relevant as scart could for all i know use seperate
sync signals. but if it does then this should be all the info you need.

if you wanted to you could *possibly* use a ttl chip like the74LS00 to
invert the hsync signal to enable the use of cga moniors.

any questions *may* be answed when i get around to reading my mail.

Greetings...
Having a CT2 installed to my Falcon..
The question is about SIMMS thoe...

To begin with, I hope to use a 32meg SIMM, but I happen to have
a pair of such SIMMS, and wonder if per chance a device might exist
that can hold two SIMMS like this and make it act a like a SINGLE
64meg SIMM?

If you know of such an adaptor, please let me know where it can be
found.

Thanks,
Brian

I am pretty sure the screw holes are in the same place but a little modification
may be required on the back as the STe has 2 RCA outputs below the power switch.
Im reasonably sure everything else is in the same place. Although your keyboard
connector may be different. (remember noticing that on a 520 ST).

Getting one is easy. Nobody in the Atari replacement part business sells for cheap, though... ;-/

You might have better luck upgrading to a MEGA-ST or MEGA-STE.
Those sell for rather cheap these days.

Any CT2 board works with orignal EDO modules only.
SingleModules, no Adaptors, no pairs of old Simms from anywhere.
(Best with 8-chip modules)

Other simm modules won�t work.

CT2 Rev. "A" 16,32MB
CT2 Rev. "B" 16,32,64,128MB Modules

Some orignal atari ram boards (ST-RAM) doasn�t work too in turbo mode.
Vertical flickering lines in 800x600x265 video mode is the sign for..

Replace board to eliminate that.

Regards, Robert

Why not just get a new machine ? They range from free to UKP 30
nowadays.

The holes are in the same place, but the STE requires more holes because
of the extra connectors.

Forget forget exchanging motherboards. Get a used STE for 20 UKP. The
STE case is slightly different because of the extra connectors. The
internal shielding is also different. Then you can keep the STF and have
a spare drive, keyboard and PSU that way, which are the most common
parts to fail.

Sounds like you have a faulty MFP (MultiFunctional Peripheral).

This is a Motorola chip with the marking 68901.

No....the twin to single SIMM converters will turn two fours into an eight or two 16's into a 32, but not two 78's into a 16 or two 32's into a 64....That's how it is with SINMM's I'm afraid...

Gang,

sorry to bother again, but my Atari 1040st is freaking out. heres the problem:

When I put a disk in and boot up the computer everything is fine until I
try to access the A drive. It says there are "zero bytes used in zero
items" despite the fact that the disk is full of programs. Ive tried
several disks all containing files, but it keeps saying that the disks
are empty. Whats up? PLEASE tell me my beloved atari is fine!!!

The main thing is to ensure your modem speed (in Win95's modem properties) matches your MagiC-PC port speed setting, and that the PC can handle MPC's serial port speed. I have no trouble (so far) with 115k on a PII/300. You also need to set the port speed to match using the serial CPX which comes with STinG.

I had a lot of problems with STinG under MPC: it worked at first once I had the speeds sorted, then stopped working one day and I couldn't figure out what had gone wrong. Turned out to be a problem CACHE.DNS file: deleting it made the whole thing start working again. Symptoms of that one were that it dialed OK and said it was connected, but clients would just lock up due to no data transfer.

>I also heard that you could make a network, so you can surf with the
>PC and the TT at the same time. Does anyone now something about this?

This one's out of my league, sorry. I have been meaning to try networking my STE to the PC using STinG for a while, but haven't tried it yet. I'd be interested to hear how you get on.

STinG allows IP masquerading which (theoretically) means you could network
to the PC and access the net via the PC's Winsock connection using the same
IP address (masquerading is 'pretending' your machine is someone elses machine,
according to the IP address...).

Also I've never tried it (my Falcon and the PowerMac 7220 I type this on
could get together one day...that'd be kinky for sure!)...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

That is not quite correct. It is the system that drives the modem port which
must support Masquerade if more machines are to use that port. In the example
you give that system is the PC.

My Masquerade module can only help if it is running on the system that does
drive the modem port, and when it is STinG that does so.

It is possible to do this on a PC too however, when running MagiC_PC.
It is also possible to do it on an Atari machine, and then route other
machines to Internet through the Atari machine. There are many solutions.

>Also I've never tried it (my Falcon and the PowerMac 7220 I type this on
>could get together one day...that'd be kinky for sure!)...

The same basic principles apply for use with Macs as for PCs, except that
the MagiC implementation you may then choose to use is MagicMac.

Since I use neither Macs nor PCs I can't give any more direct advice on
exactly how to set things up at their end of the local network connections,
but I know others use such setups and hopefully they will also respond
with advice for you.

>several disks all containing files, but it keeps saying that the disks
>are empty. Whats up? PLEASE tell me my beloved atari is fine!!!

This sounds like a disk full of software that is NOT in a usable file format, but a self booting disk (sector type format).

If you stick the disk in the drive and boot from it, then the boot sector contains the program to load and run the programs. This means they aren't visible from the Desktop.

In some versions of TOS the system can crash if you try and get a directory of some of these type of disks from the Desktop.

The most commonly used programs are Games and Demo's.

It is also possible to have a disk display 2 different directories on the same disk. This is usually happens when the disk has been changed and the computer hasn't updated or noticed a disk change.

It's always a good idea if you have any windows open to press the ESC key to update the selected window when you have changed a disk etc..

The worst I've come across had TWO sets of directories including TWO sets of directories down to 3 levels!!! Don't ask, as I don't have an answer for that one!!! The data on the disk was over written by the second directory structure though.

Here's stuff I've got;

SCSI Terminator 50way
SCSI Terminator 50way with pass through
SCSI 50 way to 25way cable (normal cable as supplied with a lot of hardware)

Various other cables and connectors (lots in fact, some very rare)

68040LC33 chip (has been tested successfully at 50MHZ)

14" SVGA Monitor with electronic framing controls

Akai AV Amp with internal B/W monitor (good for linking all sorts of Audio and video equipment together. Also has fake suround and shapness control. Originally 240 RRP (paid �200)

Amiga 500 with monitor and printer and spare 500 without internal disk drive

Acorn Arm250 range Technical Reference Manual with pullout circuit diagrams of the various models and boards

20MHZ and 25MHZ 68881/2 FPUs (pins underneath)

Arm2 chip (12MHZ compatible) Arm3 socket compatible.

Lots of 256k Simms (obviously ain't worth much)

CD containing lots of ROM files for consoles and arcade machines. Also Atari ST and Amiga CDs

Sony 2x (340k per second) SCSI CDROM Drive bare (2 off) perfect and very good at loading difficult CDs

Intel 486sx chips

Various Bond film videos

64MEG IDE 2.5 notepad/Amiga 600/1200/Falcon type hard drive (perfet working order)

Floptical disks (21MEG each)

Stuff wanted

EZ135 carts

SCSI 50 way to 50 way cables (2 or 3 would be nice)

SCSI 50way cover

Arm3 30-35MHZ board

BBC hard drive interface or simply a duff BBC hard drive where the drive itself has gone wrong)

Mac LC630 battery

A3010 internal battery

Playstation

32MHZ 68882 FPU with side pins
50MHZ 68882 FPU with pins underneath

Pentium 2/Celeron with external cache processor

Dimm memory

This must be a later MagiC-PC than 1.2 (which is the latest in English unless SysSol have released 6.1 since the Atari show in Stafford). MPC 1.2 only has one serial port (even if the PC has more). It also has no MIDI ports, which leaves the parallel port, and if you use that how do you print? So you can either have the network *or* talk to the modem, not both at once, sadly. MPC limitation, not STinG.

Of course if you have an Atari machine with more than one serial port (faster than the STE's 19200) and use an external modem on it you could go the other way.

Here's a challenge for the technical historians out there:

I have an Atari PS3000 monitor (12" color monitor with floppy drive built in). I assumed they just mounted a standard 354 SS/DD mechanism, but noooo, they put some strange custom hack in. So when I opened it up to install the 314 DS/DD mech that I just bought, I found that it doesn't have the standard IDC header connection, it has a flex cable. And there only seem to be around 10 lines on one side of the flex. Also, I haven't put a meter to it yet, but it looks like there may not be a 12V line, but I'll figure that out for sure later.

So, does anyone have the data pinouts for the monitor and drive so that I can make an adaptor?

Thanks for any help,

Dan

Hey everyone. I purchased this ST setup a while ago hoping it'd get some good use out of me... man, was I mistaken. The most I got done with it was replacing the broken floppy drive. 8*) Anyway, here's the basic run-down, e-mail me for specifics:

Atari ST 540 main unit
SC 1224 color moniter
Color printer (with parallel cable)
Working mouse (original, great working condition)
Bunch of software
Standard Atari 2600 joystick (works with ST)

STs are great computers and still supported to this day! From what I hear they're great for MIDI sequencing, and a lot of people go on the 'net from their STs and everything.

First $75 and shipping gets it (or if you wanna pick it up, minus shipping). First $100 and shipping (or if you wanna pick it up, minus shipping) gets an external HD and external CD-ROM with it (don't know size or speed, GUESSING 540M and 2x). I don't think they're specificly for the ST, but they were in there when I got the setup, so I'm guessing (GUESSING!!!) they were used in conjunction with the ST (cables weren't and aren't included). If you buy the HD and CD-ROM and they don't work with the ST, then it's TS. 8*) I take NO responsiblity if they don't work with it, don't come crying to me if they don't work with it.

Shipping for this puppy is gonna be a lot, it weighs a ton (not literally). It'll be sent UPS 'cause I don't think the USPS will take something this big. If you're interested, e-mail me at legacy6150@aol.com Thanks.

Hi Folks again,

I wasn't sure how much a complete machine was as I've been out of the "scene" for a while :) I've already repaired the PSU once, so I spose it is about time to get a new machine.

You say an STE is about 20 squid. Will I be able to use the 4Mb memory from my STFM in the STE? Also....how much is a Falcon these days?
I've wanted one of those since I first saw one. We've got a blue G3 and an iMac but I still want a Falcon! :)

Thanks for listening

James

Hi,

Recently I posted a msg in which I said that one audio output of my Falcon was dead/broken. It's actually very faint; when I play something like a .mod file and the volume is completely pumped up, then I can hear the sound of that .mod channel. It's faint, but one can hear it. There's also a lot of noise in the broken channel, much more that in the other channel.
Does anyone know if this indicates a typical problem (like a broken R or C) or can it be anything?

Grtz, Arthur

This must be a very low price, I've not come across many STFM's at that
price let alone and STE! I must be missing something;)

>  Will I be able to use the 4Mb memory from
>my STFM in the STE?

You won't unless the FM has been upgraded using something like
Marpet/Frontier Xtra RAM Deluxe.

I do 4 meg upgrades with fitting instructions, software and postage for
�17.50, or �22.50 for the very rare STE's.

>  Also....how much is a Falcon these days?

The prices for Falcon's are exactly stable. The lowest I've seen one go
for is �135 (4meg and IDE) via Eswap auction, they can range from �200+.
The average price I've seen over the last month is �225.

Cheers! for now
Steve

It sounds like your disk drive is faulty - either the heads are not making contact with the floppy, or the heads are damaged (or the disk drive motor is not working - can you hear if the disk is turning?). But replacement PC drives are cheaply available for around 12 UKP, and not difficult to fit. A drive-select jumper may have to be moved and the connecting cable inserted upside down compared to a PC - also you may have to cut a bit of the case to clear the eject button, unless you can modify the drive to use the old one. There are instructions available giving etails - but I can't recall from where. :-(No doubt the author will soon let you know as he reads this topic!

Has anybody managed to get an Iomega ZIP drive going ok on the SCSI chain on their STe? I have a "The Link 2" with CD-ROM and EZ135 connected to it at the moment, and am toying with the idea of sticking a ZIP drive at the end of the chain. It appears to have 25-pin D-connectors instead of the proper 50-pin centronics ones though (?) - so my nice little 50-pin terminator block won't fit in it. Would I need to make a short cable to attach the terminator into the 25-pin socket? I would like to know if anyone's got one going already, and if so, how have you wired it all up?!

Cheers,
Gary.   (gaz+liz@...)

 |all up?!

Gary,

I've got an IOMEGA ZIP 100 running. It's a slow bugger (about 2/3 the speed of my SyQuest ezFlier 230), but it works.

I've got it in a four bay SCSI case (it's an internal model... don't know if they made an external SCSI model). The ribbon cable in the case fit without my having to add an adaptor of some sort (I just hate having to do that).

I'm using MagiC and HD Driver on both a Mega and a TT. Like I said, it's a slow little fella, but it does work.

Good luck,

Joe Mirando @ A-ONE Magazine

I did that once, but I just traced the lines from the ST floppy connector (which you have a pinout for in the owners manual) and matched them to the standard PC floppy pinout.

So when I opened it up to install the 314 DS/DD mech that I just bought, I found that it doesn't have the standard IDC header connection, it has a flex cable. And there only seem to be around 10 lines on one side of the flex. Also, I haven't put a meter to it yet, but it looks like there may not be a 12V line, but I'll figure that out for sure later.

If your STFM has a RAM extension board, then that's out. But if that
board uses 1Mb SIMMs, then you can reuse these directly, since the STE
has 4 SIMM slots.

> Also....how much is a Falcon these days?

They usually range from 150 to 300 UKP, depending on RAM, disk and
software provided. The problem is more like "Where can I find one", they

are getting pretty scarce.

I have exactly the same problem on my left channel. Inputs are fine.

I'd like to know how to fix it too, because my closest repair center is Centek and they are 900Km away.

With me it's also the left channel and the inputs are fine too. Do you
know if you did something odd to your machine when you first noticed it?

Actually, it already had the fault when I bought it (well, I actually swapped it in for a stupid Mac SE/30). The previous owner told me about the problem, but Falcons are hard to come by in these regions, so I took it all the same.

Hello!

The church I am with is about to get a Falcon030 for use with our keyboard.

The name of the keyboard is the Ensoniq KT-76, with 64 voice, weighted action, and has General MIDI.

AS I am setting this up, which sequencer/midi program should I use? I have several CD ROMS, especially the "All Things Falcon" and the "Falcon030 Select CD".

As I am the one getting the system setup and such, I have limited funds. I need technical help, and potential PD/shareware software I can use.

The Falcon has the full 14 meg memory and will have an IDE HD.

Thanks for any help!

Take care and God Bless!

Regards,

Jim W. Krych

Hi, all.

I have, as stated in previouse posts, got myself a CornerStone Dualpage 19" b/w monitor. I would like to be able to use this monitor on my TT, but I have no info on what the TT's ECL signals are like. The DualPage model is M/10720, and it is basically the same as model 120. This is the info I have about the DualPage.

Cornerstone DualPage 120 Display Specifications

Resolution:	1600 (H) x 1280 (V) pixels
Display Size:	19" diagonal
Screen Area:	13.8" (H) x 10.8" (V) (353 mm x 262 mm)
Video Bandwidth:	262 MHz
Horizontal Scan Frequency:	105 Khz
Refresh Rate:	76 Hz
Scanning:	Non-interlaced
Phosphor Type:	P-104
Video Signal:	10K differential ECL
Overscanning:	User selectable

I have tried posting for info on this before, without luck. So, I try again, now with more info on the subject ;-)

What I have to know, before contacting CornerStone tech-support, is the ECL signals the TT use, and what other signals are involved when using a big-screen in TT-high res. So, if noone knows if I can connect this one somehow, I need at least more detailed info about the TT's ECL signals than just "TT uses ECL..". Anyone?

IIRC it is being developed by Istari (Sweden) and Core Designs (UK)...They're also responsible for the Eclipse graphics cards/PCI adapter that is about to release (like in the next few days....)....I'll be reporting on the Eclipse ASAP as I have already paid for mine and have a 21" Dell Ultrascan waiting for it here :-))

Well, referring to my copy of a field service manual, what goes to the mono monitor are MOUT and XMOUT, which come from DP8516 44-pin j-lead, which is powered from +5 and -5 volt mains. I do not have a data sheet for that IC, but it should answer most of your question. Those are pins 4 and 15 of the connector. My suspicion is that the differential voltage goes from zero to ten volts.

HSYNC and VSYNC are pins 13 and 14 of the connector, and come from U204, the TTVIDEO chip, which is powered between +5 and ground, so those are single-ended TTL.

XMONO is on pin 9. It probably expects a ground from the monitor, if it is like other Atari products.

There are two ways of getting power out of a transistor output stage. One allows connecting a load beteen the positive supply and the collector of of the transistor. The other allows connecting the load between ground and the emitter of the transistor. That is what ECL means. It has speed advantages, something about charge clearing time, I think, but is not mysterious.

A TTM195 monitor, by its service manual, calls for Input Signal Video of Balanced ECL, 120 ohms line to line. The horizontal frequency is 71 kHz, and the vertical freqency is 71 Hz, more or less.

Now: what precisely was the question?

I myself use no PC systems at all, so I have never tested MagiC PC myself,
but reliable testers have reported using MagiC_PC to network with other PC
systems.  It is very probable that they did use newer MagiC_PC versions,
since to some of them both english and german are equally foreign languages.
(I myself am swedish and use both english and german program versions.)

>
> AS I am setting this up, which sequencer/midi program should I use? I have several CD ROMS, especially the "All Things Falcon" and the "Falcon030 Select CD".

The best sequencers are, and always will be, Cubase and Notator. Both are commercial, and both are unsupported, so it's down to finding a 2nd hand copy.

There are a few freeware/shareware sequencer programs, but none of them is really top notch. You can try Sweet16 from:
http://home1.swipnet.se/~w-11396/

There are a few others, but really not too good, on FTP sites like:
http://www.umich.edu/~archive/atari/

I doubt you'll find any of these on your CD-ROMs.

The latest sequencer would be Softjee's Devil Studio audio sequencer (quite amusing if you'll be using it in a church!), which looks pretty good, but isn't quite finalized yet. Not too expensive though.

> As I am the one getting the system setup and such, I have limited funds. I need technical help, and potential PD/shareware software I can use.
>
> The Falcon has the full 14 meg memory and will have an IDE HD.

That's much more than enough for simple MIDI (a 1040 STF is quite sufficient for that), and for MIDI+Audio you would need an extra SCSI drive.

> Thanks for any help!
>
> Take care and God Bless!

Well, it's not really my cup of tea, but thanks.

Nick

Hi there !

I have an ATIN upgrade card (TOS) for my atari 1040.
The only thing that's left to do now is burn the EPROMS

But.... which EPROMS do I need for burning ?
Is there anyone who can send me the program for splitting the ROM image?
(the odd- and even story!)

Please reply to martijn.kruger@solvay.com

Greetings,
Martijn.

<gaz.liz@zetnet.co.uk> writes
>Has anybody managed to get an Iomega ZIP drive going ok on the
>SCSI chain on their STe?
(snip)

Yes !
I have been able to run both Iomega Zip and Jaz drives (though not at the same time !) from an Stf, a Mega 2 and a Mega 4 using Toplink as an adaptor with no problems. Toplink is powered by the termination voltages in the SCSI connector so it must be the first in the chain and connected to a full size SCSI connector. These connections are left out of the smaller connectors at the back of the Zip and Jaz drives.
Despite getting around this problem by providing a separate 5 volt supply to Toplink I was never able to persuade any of these machines to boot from the Zip when it was the only drive connected. Has anybody managed to do this ?

Hi

I have a problem using Calamus 93 under Magic 6.0.
(yes I know I should upgrade, but I also use Calamus
95 and 98)
The text editor doesn't work. I've heard about
this problem, but people say I have to make a
dual boot. Does anyone know how to?

Thank you

Fokko Veegens.

That would figure: MPC 6 seems to have major changes in several areas.

Anyone know if it can access more than one serial port at a time now?

Hi, all.

I've got this 21 (I think) inch black/white monitor today, but I don't have any information about it whatsoever. The ones I got this monitor from thinks that is is possible to use this monitor with the TT, to get to TT high res. Since I don't have any info about it, I ask here :) The monitor type;

Cornerstone DualPage monitor - model M/10720

This was the info I found on the back of it, and on the front it says;

ND Comtec

So, if anyone have any info about this thing, please don't hesitate to let me know. I have tried to search the web using altavista, and found a lot of Cornerstone DualPage monitor's but not one with the above model number. Any info on this is most appreciated..

Thanks.

> I read the 1986 article on RGB to composite, and the guy said 2-4K ohm

> resisters. I have also been told 33 ohm, Quite a difference.

The problem is that nobody can tell you an exact resistor, displays are all different by use the same resistors.

For an older multisync i found out that 68 R (Ohm) works fine in r,g,b and v- and h-sync wires, but you have to experiment with that.

First steps to reduce the signal level was to use variable resistors of 1K linear. So i reduced step by step the 1Vss Signals to 0.7Vss

With the resistors on r,g,b you must found exact a paper white background on -your- display, 68R works for mine, others maybee looks are different.

Use variable resistors to find out the correct resistor.

If you underrun 0.7V, picture goes bad, with more as 0.8Vss you got flicker, stripes and some other trash..
Different voltage on r,g,b makes a colorised background..
wrong colors, use a test picture with real colors!

If you found out the right point, desolder all variables, use an ohmmeter to found out the right data, replace variable resistors with an normal resistor, as your ohmmeter shows, from any electronic store.

After this session you can solder all resistors directly to the relevant pin in your monitor (cable) connector. Solder the right wires from computer output to the right open ends of your resistors..
That�s all

Works fine here since some years.

Sorry, english only in realy simple words..

Regards, Robert

> I've got this 21 (I think) inch black/white monitor today, but I don't
> have any information about it whatsoever.

The TT has an ECL type output. Question is what's the expected input for your monitor? VGA, SVGA, ECL, CGA etc? Also, it is likely that your monitor requires one specific and precise H-sync and likewise V-sync value. The chances for the coincidence of the TT's sync outputs and for the inputs of the Cornerstone monitor are slim. Most likely you would need some kind of graphic card for this to happen.

Suggestions: Try to find out what company really made the monitor. The badge doesn't necessarily have anything to do with it! For instance: The Atari TTM194 is in reality made by an american company called Moniterm, it appears the TTM194 is in fact a somewhat customized Moniterm Viking. The Atari TTM195, similar in outlook to the TTM194, is made by Philips in Canada.

I have in my possesion a Sun monitor made by Zenith and another one made by Sony.
Both of these only sport the Sun badge.

After you've found the real producer you can more easily find info about your monitor on the Internet.

Attaching a non-Atari monitor and expecting the TT-high resolution is unrealistic. At least without a dedicated graphics card.

With a little luck, provided you have a graphic card that fits your monitor, you could make the monitor work . Probably you'll have better chances on a PC with Linux.

Yes, I know that TT has ECL type output. I have no idea what this Monitor requires, or what type of input it needs. I do have a card for the monitor, but I don't have any drivers, no info whatsoever...

I'm pretty sure this monitor is produced by Cornerstone, and I have searched the web for the model number, M/10720, but I can't find any info about it.

>
> Attaching a non-Atari monitor and expecting the TT-high resolution is

Yes, I think so too.. but since the person I got it from meant that it can be used with the TT somehow, I though I'd search/ask for info, but so far I'm not any wiser :)

>>
>> Any idea what this could be?

thanks for the advice. I'd gotten similar advice from Derryck Croker at Cheshunt Computer Club and from David Encill at Core/BSS (who produce Videlity).

Unfortunately, it's not working. Videlity has a "preview screen" function built inside its configuration program, and I have no problem seeing the preview screen for TrueColour sync up properly, so the monitor can handle it. It's at bootup that's causing the problem - as I'm noticing, the monitor goes through bootup properly, but then when the desktop portion comes up the screen goes completely black and the LED light turns yellow (which indicates that the Energy Star function turns on according to the manual).

The funny thing is - I got a small AUTO folder program with my Nemesis accelerator board (also by Core/BSS) that gives you a 640x480 TC screen - this one actually works. Now if I only know what the specs are for hZ setup I might be able to figure out what's going on.

I remember that I've had a similar problem about two years ago when I first got my Nemesis; we were without our video tablet at the TAF meeting where I was giving a demo of it, so we rented a digital SVGA monitor for the night from a computer dealer down the hall from our meeting place. Videlity choked on the monitor in TrueColour, but the HRTC program worked like a charm. My new LG monitor is also digitally controlled - could there be a connection? (My previous monitor, a Hyundai SVGA that was NOT digitally controlled, handled a 736x544 TC screen nicely - I got rid of it because of my concerns regarding radiation coming off it, and it couldn't handle larger, lower colour screens without having to go to the back of the monitor and tweezing it with the knobs).

In any case, I'm very pleased with my LG - it's a nice clear 15" screen, and it digitally saves my screen sizes so I don't have to twiddle with knobs. I'm now working with a really nice 800x608x16 screen as my main work screen now (Videlity works well at this mode) and I use CAB in greyscale mode nicely. But I would like to have a higher-res screen again for CAB work (640x480 is good for looking at photos, but really stinks at displaying at CAB, as the fonts look a bit blocky)

Anyway, maybe this additional info may give you an idea what is going on. Maybe a member of your club also has a digitally controlled monitor hooked up to a Falcon?

Hi!

I have i ICD Advantage Plus(pro) St dma->scsi card .. currently there is a 40 mb scsi drive connected ..
i tried a 540 mb scsi hd and the drivers weren't able to find the disk .. so how can i fix this ? do i need a
newer os for the controller or just a new driver ? (and where can i get that ?)

seers,
felix

Well I must admit this was an older version of HDDriver (probably
around 4.5x). I did ask Uwe who made some suggestions but nothing came
of it so I gave up on the floptical (which is languashing in a
cupboard somewhere).

Spencer

ATARI STBook (1992) is now for sale.

Specs: 4 Mb RAM card (Toshiba) is installed,
       HDD is IDE 2.5" 230 Mb,
       external 1.44 floppy with ACSI port on its case,
       power supply and charger + 3 home made batteries,
       black serial mouse + driver,
       custom software.

       Computer can not be used currently (display connector needs
       resoldering, or else...don't have time or need to check, worked
       fine last time I switched it on, though). The upper side of
       the case has small cracks on it.
       WILL sell for spare parts! (but as whole package)

Make your best offer at my E-mail address: sandrija@pravo.hr.

Hi,

A couple of years ago I brought my old Atari ST 1040F to my wife's =
school as a
game computer for the children in het class. It has become the most =
popular
computer at her school.

Yesterday she brought it back, several problems. :-(

To fix one of these problems I am looking for a wiring diagram to =
connect the=20
video out of the Atari ST to a monitor with SCART connector, this =
because severel
of the wires in the cable are loose and I don't know which wire goes =
where.

Please help me, my wife, and the 16 children in her class.

Thanks for reading this,

Kees Maas
Stiphout
The Netherlands

>loaded, added 2 names.
>All names look good.
>and saved.
>Output nicely back to namW[171]

Adding names to an existing symbol table and then saving does work here too. It is when the saved table is to be loaded again in a later session that the bug strikes, causing TTD to bomb. Usually I can then edit the 'index' value to 255 and then get the IDX file loaded again, but the same problem returns if I then save the file again.

>I have TT030 4Mb STram 4Mb TTram. TTM194, NVDI 5

My main system (used in my TTD tests) is:

Falcon030+CT2B, 14Mb ST-RAM, 32Mb FastRAM, VGA 960x720x8planes, NVDI 5

>I have always lots of memory available,
>so I have a look at all the malloc's, to check the checks.

I also always have lots of memory free in my TTD sessions, so lack of memory is not the reason for this problem.

----- snip ----- re: DevPac excecutable program file format with long symbols

I never found truly 'authoritative' definitions for many IO addresses, and some that I did find were too 'unspecific' for my taste. I want symbols that will fit in well with my assembly libraries and not conflict with symbols likely to be needed in any programs. I've been working on and with my libs for appx ten years now, so it would be a bit awkward for me to change all of my sources now.

>> This
>> set is a slightly upgraded version of the one used in my older sources.

Yes.

>Are you sure you didnt inadvertantly corrupt the format of the indexfile?

Yes. If I edit the 'index' in Everest I can then load the file.

>Do you have lots of memory free, more than about 3 times the size of the object file,
>after loading TT-Digger, before loading your program ?

Appx 27 MB FastRAM is free, plus appx 10 MB ST-RAM.

>(I checked the malloc's but one never knows)
>Could you retry with the unzipped version in the folder TTDIGGER on my homepage?

I will try again with latest version of course.

>Does the file you disassembled has these long names?

No, that executable file contains no symbols at all.

Hi Henk,

on Sun 16-05-1999 18:08 Henk Robbers wrote:
>
>I start a new thread because the stuff indents out if sight ;-)

Ok, though I guess that depends on the news program used.
I use NewsWatch+OKami, and have not noticed any problems.

>I mmanaged to get my Magic stopped with a memoryblock violation
>error.
>
>I fixed this.
>It is on my webpage. Same filename TT54C.ZIP
>It is also in the folder.

Sorry, but that fix is not complete.
I downloaded that version, and it is this that I refer to in the other
two posts I'm sending in this newsbatch. Possibly you have already made
yet another fix since I was 'out on the net' last (over a week ago now),
so I'll check your page again.

----- snip ----- re: extending tables
>
>This is the real story:
>I read the number, if it is below a usefull value, I replace with that
>value, then double it. So each time you load a indexfile you get at least
>as much room to add names as there are already.

That sounds ok to me, but so far none of the versions I've tried have been
able to do this correctly.

>That means that a table can become full. There comes the message.
>If this happens while adding interactively, just save IDX and reload again.
>TTD still writes the actual number of names to the index file.
>
>There was a little bug in checking for table overflow.
>
>I could find this bug by lowering temporarily the "usefull value".

>Conclusion:
>If you dont want to know use a sufficiently high value, not zero.
>I did that originally in the MEMIO.IDX, where I put in 255.

Unfortunately I get problems both when I leave the value as saved in the
IDX, and when I try a higher value (edited in Everest).

>P.S.
>
>Producing config files that can be read by a human being is nice and
>platform independant, but has a certain danger.
>It is very tempting to fiddle with it. ;-)

I know, but there is one very great advantage, which is that a human can
correct values when the program can not deal with loading those that it
has itself saved. If it were not for this ability I could not use TTD at
present (at least not with symbols).

I have managed to get my hands on some more memory, as usual they will
come with fitting instructions for the STE, I'll be adding SIPP and Mega

STE instructions soon, a disk of software on a memory theme and postage and packing for the UK; post will be extra for overseas Atarian's.

STE and Mega STE

520/1040 to 2 meg	�10
2 meg to 4 meg	�10
520/1040 to 4 meg	�17.50

SIPP's

520/1040 to 2 meg	�15
2 meg to 4 meg	�15
520/1040 to 4 meg	�25

With every 4 meg purchased you will receive an edition of ST+ Fanzine.

Now there's no excuse not to upgrade your STE/MSTE;)

As always payment can be in GBP or USD (USD cash only)

Hi Ronald.

Glad you're back again!

My TT is temporarily off the power, because I am redesigning the desk. (the real one). My new spectacles make this necessary. o^o

I think I havent tested with a binary with no names (I am not sure though) I'll do that as soon as possible. I'll must also see if any cr/lf combination could do harm (which shouldnt of course).
I'll let you know.

Henk.

Thanks Laurent!

Henk, I just want to confirm that this is exactly what I see in the example files I was preparing for you. This is the format TTD needs to implement for full compatibility with DevPac symbols. I meant to send you those files several days ago, but I got caught up in some hardware problems. Thanks to Laurent's description I guess you don't need them now anyway.

It was posted, but I got it with the same batch as this new post anyway ;-)

It is up to the newsclient APP which news it fetches, and it is quite normal to only fetch each post once, and to erase it shortly after you have read it.

How 'shortly' that will be is usually configurable.

>Now that I know that the sync levels of the ST/Falcon(RGB) are okay,

Good, but what about the sync frequencies ?

>
>
>I read the 1986 article on RGB to composite, and the guy said 2-4K ohm
>resisters. I have also been told 33 ohm, Quite a difference.

The resistor values you need depend entirely on what kind of attenuator you need, and that also depends on the cable length you will need.

A single low resistor per colour lead can suffice, if it is connected between that line and ground. The drawback of this is that it really overloads the emitter follower output stage of the computer, and leads to an assymetric attenuation (== signal distortion).

A higher value resistor in series with each colour lead can do the job, but the value then depends entirely on the input impedance of the monitor, and if that is fairly high the cable will become very sensitive to any interference signals (and there are plenty of those around).

A better way is to use a proper 'PI' or 'T' network for each line, but since we know that we have a low impedance emitter follower on one end, this can be simplified to a simple two-resistor 'half PI' or 'L' network.

Thus, if we have a standard 75 Ohm monitor input, and use 75 Ohm cable (as we then should), and we want to attenuate by a factor of appx 2.5, then we can use a network like the one below for each colour lead.

```
                   +----------------X Coax center X------X Monitor input
            R1     |   R2                                  RL = 75 Ohm load
Output  X--/\/\/\--+--/\/\/\--+-----X Coax shield X------X Monitor ground
           91 Ohm    750 Ohm  |
Ground X----------------------+
```

This neglects the emitter follower output impedance, which is normal for emitter follower calculations.

Actually the formulas for this filter are:

$R1 = (RL*D/2)-RO$ $R2 = RL*D/(D-2)$

Where RO is the output impedance and D is the attenuation, which must be larger than 2 since it includes the normal 6db loss of feeding a balanced load.

If the input impedance of the monitor is higher, you can still apply the formulas above, except that you must then keep your cable shorter to avoid interference, as the impedances of the network and the load are no longer balanced at the same value as the cable.

```

I'm going to move the IDE/2.06 interface from my Mega to the STacy, and I was hoping that I could use the old SCSI-interface from the STacy in the Mega. Is this possible without too much hacking?

The MEGA-STE and Stacy use the exact same part number, afaik.

However, I'm just curious how you will fit the IDE interface in the
Stacy.....? ;-)

Can you send me the indexfile exactly as you saved it with TTD.
(Can you send it as a binary)?

I'm not sure yet, but with a bit of cutting there should be plenty of space inside. I'm considering cutting away some parts of the shield and the entire battery-compartment to make room for some upgrades.

I'm not familiar with the STacy, but if the interface works like those
used for MegaSTe, then it should work fine for a MegaST as well, though
you will need to connect it differently of course.

Organization: Telenordia
NNTP-Posting-Date: 28 May 1999 23:51:42 GMT
Newsgroups: comp.sys.atari.st.tech
```

Here's your Atari to SCART cable:

```
Atari                      SCART
1------- Audio------- 6
6-------Green-------11
7---------Red-------15
8---------+12V-------8
10-------Blue--------7
13------Ground------5+9+13+17
9+12----Syncs------16+20
```

On the Atari side pin 9 is Vertical Sync and pin 12 Horizontal Sync.
On the SCART side pin 16 is Vertical Blank and pin 20 Composite Sync.

The SCART connector is easy to solder, but the round 13-pin Atari connector
is a pain. Here you should fixate your connector first, for example you
could stick it into the female in the computer. Begin with the innermost

pins (6,7,10) or you won't be able to reach them later because the outer pins will be in your way.

If you'd like to be able to record your Atari screens to a video you'd have to make another version:

```
Atari                        SCART
1---------- Audio------- 6
13--------Ground------5+9+13+17
2----Composite Video------16+20
```

But the picture won't be as good as in the previous version.

Use a long enough cable. 4-6 meters if you have a 28" TV and want to sit 3-4 meters away.

Good luck!

MG

If you have access to an Amiga (any model) I'd suggest you use the inbuilt
speech features of the OS/hardware. I believe Das Boot used speech created
on a stock Amiga and C64 with a speech cartridge (MagicVoice?).

Just a suggestion...

You can get SIMM to SIPP converters. The converters are little bits of plastice that the simms click into, with pins underneath. I got some, and they cost about �5 or something very small. If you live in england, I will send them to you, if you want, since I don't need them, and I can't see me ever getting a computer using sipps, now that they are long gone.
Please e-mail me if this sounds like a bargain to you, and you live in UK.
I'm afraid I couldn't send them to you straight away (they are at my parents house) but I would do so at the first opportunity.

well, where's a diagram for the ST side of things, this is from the atari ST manual (about the only usefull thing in the book :)

I would be interested in the scart side of things if someone can help.

This diagram is from the back view of the ST.

```
 4  3  2  1
 8  7  6  5
 12 11 10 9
     13
```

1-Audio Out
2-Composite Video
3-General Purpose Output
4-Mono Detect
5-Audio In
6-Green Out
7-Red Out
8-12-Volt Pullup (Ithink this can be used in scart to auto switch to the scart channel on the telly, but if your telly blows up, don't blame me :)
9-Horizontal Sync
10-Blue Out
11-Mono Out
12-Vertical Sync
13-Ground

Bonjour,
Je n'ai toujours pas eu la solution pour faire fonctionner mon Calamus 1.09 via TosBox sur mon PC compatible IBM avec windows 95.
Le Calamus 1.09 (date de calamus.prg: 1993) de quelqu'un d'autre fonctionne bien avec Tosbox, mais mon Calamus 1.09 (date de calamus.prg: 1989) ne

fonctionne pas du tout avec Tosbox et indique le message suivant:
"can't start Calamus
can't load Calamus.cef
press any key to continue"

J'ai pourtant mis les m�mes lignes du fichier calamus.set et de tosbox que ceux de l'autre personne, mais sans succ�s sur mon Calamus. C'est la m�me version 1.09 mais pas la m�me ann�e. Il y a quatre ans de diff�rence concernant calamus.prg.
Que peut bien �tre la diff�rence qui ne fait pas fonctionner mon calamus. Je suis pr�t � l'envoyer par e-mail (temporairement) � celui qui voudra bien essayer de le faire fonctionner avec tosbox ou un autre �mulateur (il fait environ 291 Ko compress�).
Merci d'avance.

Thanks to Nick for the FAQ !

Anyway my problem (earlier episode) is only partly solved. I am
afaraid the HD unit I have cannot be fitted to an Atari
computer. I did the test of fitting the Falcon HD unit on the
MegaSTE and it just worked fine...so it has to be the drive, as
I tried any possible jumper/cable setting :(

Stephane

Pas de probl�me:

1) Metre le lecteur en DS0 (ou 1 enfin inverser)
2) Fixer le drive dans le STE
3) Metre le cable de plat dans le sens inverse (tourne de 180�)
4) Attention bouchez le trous des disqeutte HD

A+

I have a PC with MagicPC. The modem I use there is faster then the one
I use with my TT. But I can not use this modem on my TT for one reason
or another. So I would like to use MagicPC to connect to the internet
and bulletin boards. Does anyone now of problems I can expect?
I also heard that you could make a network, so you can surf with the
PC and the TT at the same time. Does anyone now something about this?

Cecil Westerhoff.

It should be the same. However, you could probably only be using a
640x200 resolution.

That would be Berny Diotte. Brilliant fellow and life-long Atari devotee. He built himself a nice, long soldering blade to handle this. However, the safest method is to use a professional hot-air desoldering station. If you can't afford one, drop by the nearest electronics college and ask nicely if someone could do it for you. Just bring the daughterboard and the necessary chips, plus a little money for the brave student who will spare his time to do it.

If your video card has an RGB output, why not.

But Windows in 640x200 would be no fun, beleive me.

I set up my atari again the other day - I remember speech engines that sounded quite cool in a retro way (they do now anyway - I remeber being amazed when a computer spoke!). I want to use some samples of this speech in music I make (anyone remember that "Das Boot" track?)

Does anyone have any speech engines to distribute? If so, please email it to me, or point me to it, whatever!

Thanks for any help,

Simon H.

I too would also like to find a reliable speech engine, preferably one
that would work with MiNT. Anybody want to code a device u:/speech ?
;-)

I had this idea to make my IRC client actually speak out load, however
have not found a stable way to do that. Speech.TOS seems to work for
a while then crashes on my TT.

You can go grab "Talking message creator", it must be well over
5..maybe 6 or 7 years old.. but you can set a lot of the speech
configurations.. pitch and vol and tone and oooer.. and get it to talk
for hours..
http://web.ukonline.co.uk/accrington/stosser/ look under titles..

Beware...the program is very old..not exactly state of the art and one
of the first things I ever made.. so dont expect too much :)

Hello!

I have recently installed SAM and Paula on my Falcon030. I have a full 14MB
RAM, and other stuff, several hard drives, etc.

When I try to run the Arrival Demo, it's like I am getting a really slow
demo, both the sound and the graphics are slowed down. Did SAM or Paula do
anything?

Regards,

Jim

oops!

I checked the demo again, only the sound is slowed WAY down? Anyone got a clue?

Jim

I'm looking for a schematic of the sound output of the Falcon, ie. the components that are pretty close to the output connector.
The Do-it-yourself doc about the Falcon discusses something about the audio system, but that's in German and may cover not everything (I think).
I believe there was some accelator for the Falcon (BlowUp?) that had some modifications to the audio part. Does that contain a detailed description and are the docs free?

Grtz, Arthur

Hi

I'd like to thank all those whom responded to my frustrating problem, I have now sorted it out;)

I've enclosed an email I received from an Atarian, that doesn't look like it had been posted in the newsgroup. As I think it could possibly help someone else I've stuck it below: (continued after message)

<<<<<<<<<<<<<<<<==============================>>>>>>>>>>>>>>>>>>>>

On Tue, 18 May 1999 at 04:58:10 a message from Bob Poggioli was created on the subject of MO Optical drive Blues:((Still... More info!.
>
>Recently you wrote in comp.sys.atari.st:
>
>I don't know if this will help you with your problem but I have a
>couple of MO drives which are only recognized on my system (ICD Link2
>hardware and HD Driver software) if I set the SCSI ID to 5 and place
>them physically last in the SCSI chain (and, hence, I can only use one
>of them at a time). I do not know why they behave this way but,
>since they are old units, I suspect that their SCSI implementation is
>faulty.

<<<<<<<<<<<<<<<<==============================>>>>>>>>>>>>>>>>>>>>

Well after spending the best part of 4 hours finding all the docs I could find on Fujitsu web site and messing around with dip switches, the above email got me thinking! So I thought I'd go through all the ID settings, starting at device ID 1; I needed my main hard drive connected, I couldn't be bothered to actually change it's ID.

Anyway, lo and behold using ID 1 the drive sprung to life!!! I didn't try any other ID setting; I'd already tried 2, 4, 5 & 6!

I found out that using HD Driver with the ID at 1, I got a more reliable response than my main drive! It also needed another drive attached, I don't know why as with jumpers set for 'power supplied by drive and host controller' it supplied the power to the Link II!

The drive can be set for it's own termination, with the jumper shorted, or with an external one. It also worked at the beginning of a chain as well as at the end.

Now I'm hoping that everything should be fine with the other devices; EZ drive and 3 x CD multi-changers.

Unbelievable that something so simple would cause a loss of my hairs on my head, what is left has gone grey;P

So if you have a SCSI drive that's not doing as it's told, my recommendation is as follows:

Try the drive on it's own, if it's can power the DMA-SCSI adaptor. If not you'll have to leave it a drive in-line, a little obvious:)

Go through all the ID numbers with a terminator, not forgetting to turn

the device OFF when changing as the drives ID only gets updated when
it's turned off and on. (on ALL drives I've had).

Still no success, try the above without a terminator.

Then try altering jumper settings, but be methodical. If you have the
jumper settings don't do/set anything that's silly.

Lastly, try different cables or shorter cables. Not ALL cables are of
the same quality. It may be unlikely that you would have 2 bad cables,
but I did!

The idea is get the drive working, and then find out what stops it
working!

To think I sold my PD drive as I had the exact same problem with that:((
Well I'll put that down to experience.

I'm now a very happy chappy:))))))

Thanks again to all those that help make this possible;p

```

I'm not sure if SAM or Paula would do what you mention. One thing comes into my mind, and that is the fact that demos are NOT really meant to work with other software installed in RAM. Demo coders always ask you to boot with a clean system.

When I run demos (for nostalgia purposes!) I boot my Falcon with only X-Control and NVDI running under standard TOS. Most demos will not be unhappy with that setup, although some require a completely clean system (NOTHING loaded at all!).

Let me know how you get on...I remember the Arrival demo seemed to be very fussy as to the bootup condition on my machine...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi,

I have adapted MPEG2DECODE, a bitstream ISO video 1&2 decoder, to all

ATARI platforms running more or equal to 256 colors. The decoder's binaries are available at http://eureka.atari.org/mpeg2dec.zip
It works now nicely. But, I was wondering whether someone would be able to extend the C source code, so that it could decode MPEG audio included in the stream. I've no idea of what to do, but maybe someone would do it. The sources have been succesfully compiled with PURE C 1.1 and GCC 2.8.1 in 16 and 32 bits int modes. There's more and more MPEG sequence on CDROMs nowadays, and decode them without the sound is a bit frustrating. Of course there's a need of CPU power to decode MPEG, but I have an HADES 060, and powerfull ATARI computers now apear. I think that to decode both Video and Audio, Audio should be preprocessed, and be played while decoding Video.
I've no idea of MPEG Audio formats, either than the audio stream included in video, but, my decoder decodes MPEG Audio/Video 1&2 streams without the sound for the moment. If anyone has the ability to adapt my C sources, I would be glad to send them. Maybe I could take advantage of MPEG Audio decoders that are available on ATARI.
Thanks for cooperating ...

Regards,
Bye for now,

About the extended name used under DevPac:

- used if lower byte of flag is 0x48 ('H')
- then the symbol's name if the 8 chars as usual and 14 characters following the value of the symbol.

So this gives for each symbol:

- 8 bytes for name
- 2 bytes for flags
- 4 bytes for value
- 14 bytes for extended name if lower byte is 'H'

Hope it helps,

Laurent

If thats the colour one that works on an ST and STe like the Philips 8833 then the answer is no unless you intend to use CGA or an EGA card that runs on a CGS monitor. No modern operating systems (ie above windows 3.11) support these resolutions. John.

Well,

temporarily removing SAM and PAULA did the job. Sheesh, those demos can be fussy! BTW: how many work fine with the CenTurbo???

Thanks again for all the help guys!

Regards,

Jim

I prefer the "keyhole" approach as when I took apart the screen on my "spare, dead" STacy it distroyed the sticky logo, there are a couple of identical connectors that need to be labeled, fitting the connectors through the hinge is diffucult. All in all I consider it to not be worth the time and effort, as I can have the machine dismanteled in approx 15 min my way.

I'm working on a project that requires a function of the 68040 to be emulated to support logic on an exsisting board. I need to emulate the function of the MI (memory inhibit) pin. If anyone is versed with the 040, a detailed explanation of the pins function is located in the Motorola 68040 users manual under the section covering snoop inhibited bus snooping and Memory inhibit (MI) pin details.

Looking at the signal on a scope, I think a circuit that utilizes the CPU reset during startup to pull the MI pin low, and allows the MI pin to follow the status of the TS signal might do the trick. The hard part (for me) to figure out is how to get the reset signal off the line and let the TS signal takeover control of the emulated MI signal. Sorry if this doesn't make much sence. I know what I want, but not sure how to spell it out:). There are also timing details in the MOT document that spells out what is going on better than I have.

Thanks,

Mike

Hi

I've got the drive detectable, as a previous posting.

What I'd like to know is why doesn't HD Driver detect the drive on the
other drive ID's, as opposed to just ID 1!!!!!

HDdriver obviously isn't doing something it should!

Just as a matter of interest I tried some other hard disk drivers, and
they all detected the drive!!

What happens if I get another drive and HDdriver WILL NOT detect it on
an ID other than ID 1!!!!

I'm not alone on this point. Should be start up a HDdriver SCSI device
list, where a list is kept of who got what device on x ID so we can swap

and change devices in case the above situation occurs;p

Hello everybody.

I did get a HP 820Cxi Printer. It works quite good with WIN, not so good
with linux
and it doesnt work with my Mega STE :-(
I know its a GDI Printer.
Does anyone have that printer working with a atari? Is there a way?
No matter what I tried (NVDI Magic etc) the printer simply did
nothing...

Thanks
Heiko

��I know its a GDI Printer.
��Does anyone have that printer working with a atari? Is there a way?
��No matter what I tried (NVDI Magic etc) the printer simply did
��nothing...

The problem with GDI drivers is that they don't understand PCL or ASCII ! (even a simple "print" from the desktop doesn't work !), and all HP drivers on atari use PCL.

I don't know if someone worked on that, but I think it's really a very big amount of work...

I�m not sure, but i think you found all what you need. Other thing is
the language. Nobody are intressed to translate german to english.
I can�t do that all for nothing.

> I believe there was some accelator for the Falcon (BlowUp?) that had some
> modifications to the audio part. Does that contain a detailed description
> and are the docs free?

What they are doing is to modify the clock signal. (ClockPatch) Not
more. Some other modifications, part list from atari, removes the
deep bass and change the line level. That all have nothing to do
with the blowup accelerator.

I don�t know whitch modification do you need. DOITF030 contain all
of them, also the urgend parts of audio schematics.

Blowup docs contains a detailed description to build the clockpatch, but
not one word about other audio modifcations. With a simple single
clockpatch you eliminate a part of audio noises, crackle if you use an
high display, more as 800x600x256, but also not more.

Regards, Robert

For HDDRIVER, like for any driver, the SCSI ID of a device doesn't
matter at all, i. e. all IDs are treated the same. If the ID makes a
difference there is most likely a problem with the cables or the
termination.

Hmm, that surprises me...
Anyway, in the doc I have (dating from aug '95) is chapter 5 (Problems
with sound subsys), which states that the left and right output channels
are connect to the Codec via (each) 2 C's and 1 R. In between there's a
stereo OpAmp. But are these all the components involved with sound output?

Problem is that the left audio channel of my F030 isn't working anymore,
so I want to start measuring some components. I need to know which one...

OK, I guessed; BlowUp is to enhance only the video, then?
The one that removes the deep bass etc. is the one I meant. Could that be
helpfull in tracking down damaged components?

> I don=B4t know whitch modification do you need. DOITFO30 contain all

I'll look in the (most recent) ones.

Hiya

I have tried everything, including the drive on it's own with the
jumpers set to provide power for the adaptor.

It doesn't matter where in the chain it goes, even on a basic level 2
devices, it's only noticed by HD Driver as device ID 1.

The driver DOES notice the device when the device is switch on and
before the device checks the media with SCAM mode set!!!! with any ID.

Why does HD Driver have problems detecting devices, I still have a CD
multi-changer that is invisible to it, and ICD's software doesn't?

I feel that I'm repeating what I've already mention in previous
postings.

I can report comparable behaviour of an old Syquest 44 Mb SCSI
exchangable drive.
As SCSI ID=0 with a disk in it the CD-ROM drive (ID=3) is not
installed (SPIN).
As ID=0 and no disk in it CD drive is installed.
As ID=6 and a disk in it the CD-Rom drive is installed.
Using HDDriver on a TT.

Today a funny sounding 120 Mb SCSI Seagate 5 1/4 inch came along here.
Tried all different harddisk software (Hushi, AHDI, CDHB etc.)
but only HDDriver saw that drive on the bus.

WHY?

Not that it made any difference in the end. (no partitions found (and
there are (where) 4.)

HI Steve, Hi all !

About HDDriver, have you checked with the configuration program,
HDDRUTIL I think, that all SCSI items have been validated there.
I use HDDriver on the Falcon and have HD on ID0, CDrom on ID1
and ZIP on ID 5, so it seems to work for me.

Hope this helps.

Cheers

Stephane

Hi!

yeah, I know, another video question. BUT, I am limiting down the possible culprits.

It's not a sync problem, but the RGB signal levels. They are 1.8 V p-p with a DC bias. Got to bring them down.

Just for the easy part, this will be an ST RGB cable. What value of resister are recommended to attenuate these signals down to a reasonable level?

Thanks for all the help before guys. Now that the actual problem has been traced down...

Regards,

Jim

Me too..
I don�t know why any people store old releases :-)
Get the latest one from www.atari-computer.de/doitarchive/download.htm

I think you will found all about the audio subsystem.

Regards, Robert

From what??

Only the german revoloution CD magazin have the rights to sell copys
of the crypted original .zip archives. Nobody have the right to print
parts of doitf030 in any magazine!

> This is on my revision B board.
> Check those connections and see where the sound stops.
> Maybe the soldier slip of the plug makes kontakt with (through
> cardboard sheet) to metal screening of underside!!!

Falcon 030 with 14mb RAM, math-co, and internal IDE HD mounting hardware (inside machine) [No IDE drive included]

Also includes:

DESKTOPPER with EXTERNAL KEYBOARD

Toshiba 12x SCSI (internal) CD-ROM
1.05 gig Quantum (internal) Hard Drive
14" SVGA Viewsonic (swivel base) monitor
Supra 28.8 FAX Modem (upgraded to 33.6)
Amplified speakers
10 Atari specific CD's
1,000+ disks w/ locking disk boxes

Misc hardware:
 Everything I have left. Like blitz cables, link II, Discovery
 cartridge, IDE controller from poland, extra mice, joysticks, etc...)

And everything else atari I have laying around....

Asking price: Make me offers! Highest one gets it, providing it's close to what I'd like :)

This is ALOT of stuff. It would be best to come and get it, if possible.
Depending on where your at, maybe we could meet half-way or something.

Dan Brown

I would like to buy a 16mb TT RAM card, preferably with the memory chip.

No, I don't want to pay $160 for a new one.

I would even consider buying another complete TT with 16mb.

Hello,

Im wondering if anyone uses a Laserjet 4 with Calamus 98 or 99 or with pagestream 2.2se. I own a deskjet 660 and the drivers written in calamus 98 dont work properly. It seems to stretch the page out when printing in 600dpi. Once i set it to 300 dpi the page prints fine but I need 600. I dont want to spend 200 dollars on a laserjet 4 and find I cant print legal or everything shifts 2 inches to the left---those are the kinds of things happening. I do want to purchase one but Im afraid it wont work properly and Im using it for page layout for my fathers printshop so I need something accurate. Inkjets dont have the quality and so Laser is my only option. Laserjet 4 havve 600 dpi and they seem to be used accross the board in programs (calamus 98, pagestream 2.2se NVDI 5.02).

Im also aware of the vdi module for Calamus to use the 600 driver but I want the laserjet and I need to know it works portrait and landscape. Also it needs four color speperation While being accurate.

thank you

Hi!

I don't know if this got posteed to the newsgroup-it seemed it did but was gone in a day.

Now that I know that the sync levels of the ST/Falcon(RGB) are okay, it is the level of the RGB signals that is a problem.

They are 1.8 V p-p with a 1.2 V DC bias.

The Bias is taken care of, but, what should the level of the limiting resisters be? I have to attenuate the signal down to .7 p-p. It's an obscure TV/Monitor.

I read the 1986 article on RGB to composite, and the guy said 2-4K ohm resisters. I have also been told 33 ohm, Quite a difference.

Now, I did notice that Redmond Cable does have resister loaded cables for the ST to 1080/1084, so I know that the procedure has had to be done before.

Kind of a side note, I was looking at a TV repair shop one day, east side of Cleveland, Ohio. I saw a 1983 TV from RCA that had a whole ton of RCA jacks. Not only composite video and audio input, BUT, it even had R,G,B and Sync inputs. WOW, never seen one like it, and it was rather big, 19-20"!
I guess the dot pitch wasn't so good, but that had to be neat.(Some school is using it)

Any help would be most appreciated.

Regards,

Jim

>
>pls.. email Rick@macisp.net

I assume you mean Atari!! ;-))

The 1040 part refers the standard memory size of 1 megabyte.

A 1040 ST was an old ST with an EXTERNAL floppy drive.

A 1040 STF has an INTERNAL floppy drive.

A 1040 STFM has the internal floppy drive plus a TV Modulator.

Other than that, there is no difference between them.

A good place to start on the web with questions like these is to visit
Nicholas Bales' Quick FAQ.

The address is: http://quickfaq.atari.org

Cheers!

James

The credits for this behaviour go to the original author: Han Driesen
of the "Stichting ST". I am very glad to hear that this behaviour is not affected
by my modifications. :-)

In a earlier post I mentioned the possibility of giving names to the .w operands.
There is a file SYSVARS.IDX as part of the ZIP. This file contains all the
names for the low memory system vatiables. They are from the ATARI TT profibuch.

The attachment consists of a (unfinished) effort to do the same for the "negative"
.w operands. I think the most common used are there. It is very easy to add
interactively to this list. See the description in the hypertext.

Cut the stuff between the {} in MEMIO.IDX and paste that between the {} of
SYSVARS.IDX, then move the whole stuff to your WHATEVER.IDX

Happy digging

Henk.

>So its the only 68K asm I know :-)

Even so, we do tend to prefer the tools we are accustomed to, except if
they are horribly inefficient, and that does not describe either PASM
or DevPac.

>> But the very concept of a 'cast' and its operative priority, is specific
>> to the C language.
>
>No. Casting is well defined in Algol 68
>(also struct and union are from this language).

It was so long ago that I used algol that I can't remember much of it.
I only made a few programs in it, and never delved in the deeper stuff.

>Morover casting is a process that every language, either high or low,
>either implicit or explicit must be able to manage.

That depends entirely on what you mean by 'manage'.

Essentially casting means data type conversion, and by some means or other
that sort of thing can be performed by any language capable of arithmetic.
The kind of 'casting' we use in C however, and which certainly was used
in the case under discussion, is not such a data conversion at all.

Instead it is a way of forcing a given expression to be interpreted in a
specific way, such that it is accepted as being of a specified data type
even though its intermediate value before the cast takes effect may have
been of an entirely different data type.

That is something that lots of languages have no way of doing at all,
such as (for example) many traditional BASIC dialects. They can do
runtime conversions, sure, but there is no way to write a 'cast' that
will affect the syntax analysis without generating data converting
code.

>> Any expression in the range $8000..$FFFF will fail these criteria.
>
>Motorola is a little bit ambiguous here. They let usability prevail theory.

In this section I was not really referring to Motorola rules, as much as I was referring to DevPac rules. Like any imposed rules they can to some extent be arbitrary, in the sense that they do not need any special support of a theory. It is enough that the designers find the rule useful.

In this particular case the usefulness lies in allowing some checking of the sensibility of data values for short absolute values that would not be possible otherwise.

Suppose for example that we have a short address calculation of the type

```
        "(baseconst+factor1*factor2).w"
```

If this happens to overflow into the range $00008000..$0000FFFF, then PASM will happily accept this as a legal negative address, whereas DevPac will generate an error message.

In fact, PASM too will generate a warning, but it will allow the binary to be produced, and if the warning is missed, a faulty program is used.

DevPac on the other hand will not accept such an error, but will show an error message, so there is no risk of using this faulty program.

>Although memory addresses are unsigned numbers, you must treat .w operands as
>signed numbers. That makes the following possible:
----- snip ----- re: why $FFFF8000.l is the same as $8000.w

I am fully familiar with these relationships, and agree that they are true in pure binary number theory, as well as in the PASM language context.

They are not, however, equivalent expressions in the DevPac language context.

In DevPac all intermediate numeric expressions are long, and every time any operator (even a 'cast' operator) is applied to such an expression it will operate on a long argument.

Actually DevPac too makes one concession to 'wraparound' from positive to negative numbers, a little like the PASM rule for word addresses, but DevPac only allows it for 'immediate' values.

>This means that such values fit.

Fit what ? Certainly not the rules of the DevPac language. ;-)

In fact they do not really fit PASM either, as it too will generate a warning for such expressions as "move $FA01.w,d0". Those warnings do not prevent continued assembly, and can perhaps even be turned off, but they do show that even PASM regards such constants as suspect.

>And although the treatment is that for signed
>numbers, their meaning remains unsigned. :-)

I suppose you mean that they remain addresses, and you regard addresses as being unsigned, but that is merely one convention. The whole concept of numerical addresses for data locations is a human invention, and we can arbitrarily use signed or unsigned quantities to specify them.

The important thing is that we stay consistent in our usage within a given language, so as not to invalidate the structures created in it. But there is no real need for any such relationship between different computer languages. Though consistency does help in real life. :-)

>[snip]
>
>Visibility: A point. I am working on the names of the Memory mapped IO.
>I did not finish it but it is a start. It would be nice if more than 1 person
>can add to this list at convenience. I'll send you this later.

Fine. As for adding to your list, you could always have a look at my own libs, and borrow anything you happen to like. My STNGDEVP.LZH package holds most of the DevPac libs I use, including my STinG headers, from which half of the package name comes. But the thing of interest to you here would be in one of the non-STinG libs named RA_SYS.I . That contains system variables, hardware locations, data structures, as well as a lot of macro definitions that you should simply skim past, as they use DevPac notation. But the constant definitions could prove useful to you.

The archive is in the File section of the STinG subpage of my homepage.

>What is simple for a human can be extremely difficult for a computer.
>Nevertheless there are things that are equally simple for both computers and
humans.
>Computers dont have the right to let you down in these cases.

Perhaps, but they sure have the ability to do it occasionally ;-)
Ask any windoooze user.

```

Good. This matches my earlier impression.
Much of the best software for Ataris is made by authors who simply make
what they want for themselves, and that usually is the best basis for
support too.

>> Actually I like most of DevPac's behaviour, though some of it might benefit
>> from an overhaul. But we do have to live with it as-is now, since it is no
>> longer being developed further.
>
>Is it true that it is a good and complete development system? editor, make,
>cross reference etc.

The editor DEVPAC.APP is also the shell program, and calls GEN.TTP to assemble
and MON.PRG for debugging, though the latter is often used separately too,
for all kinds of debugging. There is also an AMON version that is put in
the \AUTO\ folder to catch any bombs of \AUTO\ programs or ACCs.

DevPac can generate a symbol table listing, but whether it qualifies as a
real cross-ref I really don't know. I find little need for such anyway.

There is a link utility too, but I don't even use it, and there is no real
'make' feature. You can have multiple assembly windows, but you must give
the assembly commands separately for each one and then link them up later.

But that is not the way I like to develop assembly programs. Then I could
just as well use PASM and link stuff the C way.

Instead I use the 'include' directive, together with macros and conditionals to build a system of assembly-time linked source modules. The total project then assembes directly into a single executable file. This is commanded by giving the 'Assemble' command for the top-level source file, which thus has the same role, though not the same function, as a C project file.

>
>Ah! Thats how they behave. But is it also their meaning?.

Addresses have no particular meaning except what we choose to give them, and that can vary greatly indeed.

>Exercise:
>You have all the memory you can have (4Gig). Fill it with NOP's and
>start the processor anywhere. If it loops forever, you're right.

If that were done, then it should indeed loop forever, provided that all interrupts were disabled of course, since the NOPs would smash all interrupt vectors etc. After the NOP at $FFFFFFFE, the next opcode would be fetched from address $00000000.

It would take some tricky PMMU programming to actually do that without bombing, considering interrupt vectors etc, but it could be done.

Well, that is mostly a matter of phrasing actually.
I think we meant very nearly the same thing.

>> The concession is an
>> absolutely necessary one for compatibility to DevPac, as the form presently

To some extent yes, but that is a very complex subject.
But even without such factors it can be very hard to gain unity of any
large group to back any single idea. There are almost always splitups.

>> there were also older paper tape types

Yep. And consequently some very non-ascii code systems.

Yep, but also used in a major population poll made in USA in the 1860's.
For the looms they were controlling media, but for the poll recording media,
if I have understood it all correctly.

Hmmm, I just realized that it was a while since we mentioned anything to do
with Ataris in this thread. I think we've gone a bit off-topic.
Ah well, at least I mentioned the word once this time. :-)

Hi All,

I was given a keyboard which came off of an old 286 PC and was wondering
if it is possible to wire it so it can be used onto an STE?

The keyboard is a Philips P2815.

Thanks in Advance,

Gordy.

Hi

I have the above up for grabs. This is a very nice controller, and was expensive, it works on the Atari ST and Amiga and works out which machines it's on.

This what it says on the box, it also has a manual with it;)

"The ultimate optical controller. Precision and versatility.

Ideally suited for:
Entertainment software
Flight Simulation
CAD and Drawing
Desktop Publishing
Mouse emulation
Digital joystick games (Atari ST/Amiga only)"

It has 3 programmable buttons and comes in 2 parts; one part plugs into the joystick port and has an LCD display, and the other is a joystick that plugs into the other part.

I must admit that it did take me a while to get use to it. You can move the cursor around the screen, the speed of movement depends on how far you move the joystick; e.g. if you go all the way in any direction, the cursor moves much quicker than with a small movement.

I've only used this in the mouse port and can't say what it's like using it in the other port. Enough said I think.

I'm looking at around �30 GBP or I'll swap or do a part exchange on other gear.

Ah, well that explains some of your games problems right there. There are several utilites that will allow you to turn the CPU speed down to 8mhz if required. That should help. Also, are U using HDDriver? If so, I think you can set it so that it will try to boot from the floppy first, then-if it can't find the floppy it goes to the hard drive... Hope this helps! ;-)

I'm curious to know how these early Atari hard drives work.
I know on the BBC computer you get an interface that
converts the BBCs signals to SCSI and then you get a SCSI to
MFM/RLL adaptor which connects to the drive itself. Do these
early Atari drives work on the same principle. I.e. is there
two PCBs does one of them have SCSI like connectors. Or is
it a direct ASCI to MFM/RLL type board?

Bare SCSI Floptical drive (20MEG storage per disk) also
reads and writes to 720k and 1.44MEG disks. I.e. gives a
high density drive to normal STs.

5x Floptical Disks 100MEG of storage.

PC SCSI card for use iwth Floptical.

Instructions etc.

All working 100%.

You will obviously need to mounti it internally or put it in
case. If you need a 5 1/4 tray then I can supply one at �2
extra. You'll also need a SCSI interface of course.

Previously I mounted it in a external CDROM case.

I've used it on PC, Acorn, Atari ST, Falcon, Amiga 1200 with
no problems at all.

Can load the five disks with software too depending on what
you want.

Exceptionally good at reading 1.44 disks as it has a very
precise and accurate mechanism.

You can not use normal disk copying software with it though
as its not seen by the system as a floppy drive its a
removable hard drive.

Will also consider swops for other Atari hardware.

ICD software does support Flopticals and I think HDdriver
too. Ideal for someone with PC and ST for sharing
information.

The PC scsi card is an 8bit isa card and probably a single
device type. I've never used it as I've got an Adaptec SCSI
card which I used instead.

Will split possibly. Flopticals �3.50 each, Drive �25, scsi
card �4. all plus postage.

Also 520STFM with joysticks and games �45 including postage.

I agree completely. But Henk Robbers and I were discussing how addresses
should be expressed in two different assembler dialects, PASM and DevPac,
so our arguments were software related.

So am I. Actually I was a bit surprised, since many assembler expressions have
more than one equivalent binary form, and various disassemblers, assemblers,
and compilers choose different forms by default. Evidently Han's choices are
very similar to those of DevPac, which suits me perfectly :-)

>In a earlier post I mentioned the possibility of giving names to the .w operands.

Yes, I have seen this file, and have considered adding to it.

>The attachment consists of a (unfinished) effort to do the same for the
"negative"
>.w operands. I think the most common used are there. It is very easy to add

Ok, I'll check it out then.

Will do, but then I guess I'll have to study the HYP again to see how to
manage the IDX files. Ideally I'll want certain symbol sets activated by
default on every start of TTDIGGER, while others should only be loaded
when I request it.

Hi

Yep I'm still trying to get the bugger to be seen using HD Driver...

I've managed to get it seen, but only once. If I turn the drive OFF and on again, it will detect it in the ID screen. I can do this as long as I like, but can't get it find it after the first time!

Here is some info, hopefully this may help.

The Drive: Fujitsu M2513A

HD Driver detects this as: FUJITSU M25 13A   2000 Optical Memory

The following switch settings: ID=2

SW1
Parity: disabled
SCAM mode: enabled - it will not be detected at all with this off!!!
Device enquiry: MO
Spindle automatic stop mode: disabled
LED mode: normal

SW2 (these are all the factory default)
Write cache mode: disabled
SCSI type 1: disabled
Mac mode: disabled
Verify mode: verify enabled
SCSI type 0: SCS1
Save data pointer message: enabled
Down load mode: disabled
Factory test (not to be set by user): disabled

I have the following jumpers set:
CNH! (Terminating power and SCSI termination)

1-2 Power supplied by drive: supplied
3-4 Power supplied by host controller: supplied
5-6 SCSI termination: disabled

Totally formatable via ICD utilities although I can't get it to boot, I don't really need it too.

Totally formatable via PC.

The drive is set in the following chain/link and this gives all the above results.

Atari - ICD Link II- MO drive - IBM LPS270 hard drive - terminator
(doesn't make any difference if the terminator is on or off!)

I'd love to know if HD Driver is at fault or whether it doesn't like the ICD Link II!

--

Cheers! for now

Hi Martin,

I'm interested in the stuff you advertised, as I can use it to
move semi-large packages between my systems. At the prices
you mentioned (quoted below) I'm prepared to buy all the stuff
you mentioned (also quoted below) except for the 520 STFM.
(I already have more STs than I use.)

As I figure it that makes for a sum of 46.5 UKP,
but I'll also pay for postage of course.

You'd better check what the postage will come to from your end,
as I live in in Sweden (in a suburban of Stockholm), and these
costs are not always 'symmetrical'.

How do you want payment ?

```
Cash in letter or what ?

> would be fetched from address $00000000.
>
That answers my question.
But I also realize now, that signedness of addresses has nothing to do with this.
It is simply a modulo 2^32 operation.

> It would take some tricky PMMU programming to actually do that without
> bombing, considering interrupt vectors etc, but it could be done.
>

I should have said "mind exercise" ;-)

Greetings.
Henk.

The index file is a result of data & jumptable marking operations.
It is written by TTD itself.
You can use TTD to add names to this file.
Each prg or object file has its own index file.

Use a ascii text editor to add these .w names to each of your idx files,
BUT ONLY as a start.
Dont touch the other fields that are already there.
Of course you can delete the names you dont need.

Henk.

You could check the drive on a PC, just to see if it works.
Both possible PC floppies are coded as "B:" (DS1) drives, the ribbon
cable is instead twisted for one of the connectors.

Both Atari floppie drives are coded as "A:" (DS0) drives, so if you're
migrating a floppy drive from the PC, you'd have to recode it to become
a DS0 instead of DS1, this is normally done with jumpers.
But nothing should stop you from twisting a part of your flat ribbon
cable
so that it "sees" DS1 coded drives as DS0:s. This should be quite
useful
for wanting to be able to move floppy drives from PC to Atari without
rejumpering.

Yep.

> The kind of 'casting' we use in C however, and which certainly was used
> in the case under discussion, is not such a data conversion at all.

There are actually 2 types of cast.
1: transfer coercion. The normal conversion of 'coercable' types.
     Mostly real <--> integral, different sizes of real.
2: mapping coercion. Different sizes of integral or binary.

3: Cheating on types. :-) The lazy programmers' escape. :-) :-)

1 and 2 are almost always done implicit.
We discussed 2 and when this could be savely done.

Looks like 3. It is one of the design errors of C.

[.....]

In fact I do not care what Pasm or DevPac do. I only said that if the value
wasnt affected by the operations of discarding or inserting $FFFF, then do that
without bothering me.

[....]
> ----- snip ----- re: why $FFFF8000.l is the same as $8000.w

> Fit what ? Certainly not the rules of the DevPac language. ;-)

Fits 16 bits. Filling bits is the ultimate purpose of DevPac. ;-)

I didnt know that, and I do not think a warning is necessary.
I only use assembler when it is really unavoidable (h/w or critical speed).

[....] See other post.

[libraries]

Thanks.
I'll have a look (I hate typing what is already typed once anywhere ;-).

Groeten
Henk.

After a closer look: (sometimes I am to hasty :-)

The expression between the () is in fact typeless. Doing it long is of course the right way. If this expression would contain $FA01, there is no indication that this should be something else. OK.

But if you had this: ($Fa01.w + something*anotherthing) you can savely widen $FA01 to $FFFFFA01. Now if it's still an expression that does not overflow in the most significant 17 bits, its perfectly suited for narrowing.

In this case the .w is used in 2 ways.
1. here you have a negative 16 bit value.
2. The whole expression is also a absolute word operand in a instruction.

But I do not know if either Pasm or DevPac will accept this kind of placement of the .w
Anyhow: without the arithmatic there is no problem with that.
As I understand it, DevPac does always asume at least: ($FA01).w

I didn't. If I had spoken of the contents I'd have said 'infinitely'
rather than just 'greatly', because we can assign whatever arbitrary
meaning we wish to a stored code, so the complexity of the meaning
is then not limited by the complexity of the code.

----- snip ----- re: CPU running NOPs in all address locations

Yes, or rather the result of pure binary addition, which has the same effect
on the bits themselves, regardless of whether or not we happen to think of
the top bit as a 'sign' or not.

>> It would take some tricky PMMU programming to actually do that without
>> bombing, considering interrupt vectors etc, but it could be done.
>>
>
>I should have said "mind exercise" ;-)

I don't really plan to do it either, as it would be rather meaningless.

In fact it would be impossible to verify what happened, except by using
an external logic analyzer to monitor the CPU's activities, as there
would be no way to get the CPU itself to present results anywhere.

I already knew most of that, but I thought that perhaps TTD could use more than one IDX file. This would be useful to read in standard symbols from one file, independently of the program specific index file. But that is not really needed of course.

>Use a ascii text editor to add these .w names to each of your idx files,

Actually I am now thinking of doing it by always copying a standard index file into the folder used for each disassembly project, before I even start the first disassembly.

>BUT ONLY as a start.
>Dont touch the other fields that are already there.

No, that would be unwise of course.

I noticed something looking like an array index at the start of the file.
I assume that this is a limit on the number of symbol definition lines.
Are there any special rules about that, which I need to consider ?

Btw:
As we are speaking of symbol handling here, this reminded me of one thing
I have noticed which TTD does not handle. This is the extended symbol table
format implemented by DevPac. AFAIK, the original Atari executable format
only defined symbol table structures for symbols of 8 chars or less, so the
various implementors of assemblers and compilers had a need to extend that.

Apparently PureC and DevPac did not choose identical methods for this, so
there are programs with full symbol tables that are not recognized by TTD.
This results in only the first 8 characters of each symbol being used, and
that could lead to symbols which are not unique.

Another problem with that extended symbol format is that it appears as if
symbols are only recognized at all for the 'text' section of a program.
Symbols for addresses in the 'data' or 'bss' sections are missing in the
TTD disassembly.

In case you wonder, some other diassemblers do handle these symbols
correctly, expanding the full length symbols without missing any,
so the symbol table format itself is functional.

It would be very nice if also TTD could be made to recognize this format.

This is true in theory, but DevPac regards any xxx.w as (xxx).w,
with xxx itself being regarded as a long expression value.

>In this case the .w is used in 2 ways.
>1. here you have a negative 16 bit value.
>2. The whole expression is also a absolute word operand in a instruction.

Yes, I see what you mean.

>But I do not know if either Pasm or DevPac will accept this kind of placement
>of the .w

They don't. It is only accepted at the end of the full expression.

>Anyhow: without the arithmatic there is no problem with that.
>As I understand it, DevPac does always asume at least: ($FA01).w

Exactly.

Hi

Every external Atari ST drive I've come across has a twisted cable allowing you to use a drive set as D0 without having to mess around with jumpers!

I have had never had a problem, except with single sided drive, using a drive from the Atari (DD & HD) for use on a PC!

The floppy drives are connected in parallel to each other and so if you leave both drives as D0 you should have problems, hence the twist on the B (external) drive.

Yes, I thought the same when posting.
It could be done by allowing a similar field in the CFG file.
The one in the IDX file can be used to add to it, or even override some of it.
A little bit more tricky than bit propagation. ;-)

It is a hint from TTDigger to itself. It does not matter, (works even if zero).
TTD expands its tables exponentially. (Actually it is a start value)

[symbol format]

That is new for me. Where can I find a description?
This goes on my "to do" list.

I have nothing urgently to do at the moment.
Henk.

I snipped everything that could clarify the context of this statement. ;-)

I buy nyself the complete works of Wittgenstein, Schopenhauer, Heidegger and Monty Python.
(I can afford this by selling all my computer stuff).

Cheers
Henk.

P.S.
I think I'll start with Monty Python.

Yup, that's the one. And I can confirm that my STacy does *not* have
SIPP-sockets.

Yes, but it would make it easier get a standard set of symbols loaded.

Sounds good to me anyway.

>> Actually I am now thinking of doing it by always copying a standard index

That certainly helps a lot.
But I really prefer the method you suggested further above,
of placing standard symbols in the CFG file.

I see, so if I do enter a non-zero value, it should be a power of two then.

I'll see what I can do to help you change that :-)
But I'm not certain if I have all the details on this format available.
I'll have to search a little.

That's quite alright, as context is implied by continuity of communication.

Besides, it's one of the weirder axioms of information theory, that a unit
of information infinitely small can carry infinitely complex information.
The only catch is that it does so with zero redundancy, which means that
while the information is theoretically present, no one can understand it.
(Sic!)

Good.
It's alway best to use a rock-solid philosophy as a basis   :-)
(Also, they are a bit more entertaining, to say the least.)

I use HDDRIVER 7.XX .It works fine.The backlight LCD is terrible.
It works immediately, but you have to close the curtains to see the
effect.
In Bradley Koda's BEST catalogue there are may tips and trucs about
the Stacy.He sells also all kinds of parts, not cheap but he has
everything for sure.
I put an IBM Thinkpad external powersupply , dismantled it (you have
to work with knives and screwdrives !!) and then it fits perfectly in
the battery-compartment.So you have a very stable powersupply !
I use QED, Papyrus 7.5, Sweet 16 2.73 Full version (sequencer).
Cubase is a crime with the dongle outside the Stacy.many times it
won't boot, so I can advise everyone to buy Sweet 16.The demo costs
nothing and the full version costs only $ 30,- Works great !
I have 2 SIMMS adjusted with metal pins, so they act like real SIPP's
and I gladly already had 2 MB, so now I have 4 MB.
Contact Brian and Mario Becroft ! They are experts on modifying the
Stacy !

Nono, it is very flexible.
The function is quadratic, which gives exponential growth.
Does this sounds better, if good at all?

If created by TTD it is the number of symbols that follow.
But it is not critical, it can be any number. When it is used up, I double it,
and allocate that, copy to new and free old. Within very few steps there is
enough.
The table remains unfragmented, so I can use very fast search methods.
If you dont want to know, use zero. After saving it will be the good number.
(if the value is less than a usefull minimum I start with that minimum).

> >[symbol format]

Maybe you can create a sample program that has enough in it to show all
the differences with the DRI format, so I should be able to hack it.
(If it is not too complex). I need both a object (.o) file and a executable
with symbol table.

I hacked the Pure C format. ;-)

Hello,

I was wondering whether the Atari SC1425 color monitor
could be attached to a pc ?
Is it just another cable or through a convertor ?

Thanks !

Geert

Quite right!

There are some exceptions to this that make me use the DS1 approach
anyway, but you're of course right here.

I tried it out this week: TT with Linux from the Whiteline CD.
Put the Riebl in the TT beforehand.
Seemingly my battery is ok because I get with the boot the message:
'eth0 Riebl-Card (with battery) at IO 0xfe00fff0, mem 0xfe010000,
irq 56, hwaddr 00:00:36:04:01:32
atarilance.c: v1.3 04/04/96 Roman.Hodek@informatik.uni-erlangen.de'

That hwaddr is ok, same is on the board (sticker).

I'm guessing that if the ICD utilities recognize it, it's not the Link at
fault. I'd "blame" HD Driver if ICD's stuff handles the drive okay except
for boot. Have you tried it with parity on? Is it legit to have jumpers set
for both term power supplied by drive and by host?

Too bad it's not a Sony. I'm sure I could get you running if it was.

Good luck,

Dan

I suppose it's possible, if you have a CGA/EGA video card.

Considering max resolution of 640X200 interlaced, would it be worth it? You might be able to sell it for enough to get a cheap used VGA monitor.

I mean the connector that plugs in the back of the disk drive (the
schugart interface). The wires to the device ID's for 0 & 1 (or drive A
and B) are switched!

The format used in the IDX is ok by me. This does not really concern the
assembler anyway, since it never sees such files. The only advantage of
using a more conventional notation would be when creating a new symbol
collection, as these can not just be copied form existing sources. But a
powerful macro editor (like Emacs) can translate the format easily anyway.

>The function is quadratic, which gives exponential growth.
>Does this sounds better, if good at all?

Sure, this sounds fine, especially as it should not normally concern either the human operator or the target assembler.

>If created by TTD it is the number of symbols that follow.
>But it is not critical, it can be any number. When it is used up, I double it,

>The table remains unfragmented, so I can use very fast search methods.
>If you dont want to know, use zero. After saving it will be the good number.
>(if the value is less than a usefull minimum I start with that minimum).

Unfortunately this does not work correctly. The result depends very much on the original number I put in, and some variants (including) zero have caused misinterpretation of symbols. When that happens the result has always been that MagiC bombs with damaged memory blocks. Attempts to repair this damage always fail then, so that a reboot is necessary.

Note that this also happens when the number is one that TTD has created by itself, as result of having resaved the IDX file. In the next sesstion that I disassemble the same program and load the same IDX file, the symbols may be mishandled as described above. I have been able to fix that by editing the file and using other numbers for the 'namW[xxx]' index, but if resaved again the number in the file may still not be useful for future sessions.

There is evidently some kind of bug in the TTD code handling this.

>> >[symbol format]

>
>I hacked the Pure C format. ;-)

That is one way to do it, although it is hard to be certain that all things are covered that way, as few programs use all available features. Still, the DevPac format only contains extended symbol length, so it should be ok.

I'll send you a suitable test program, with source of course, shortly.
I will also include my latest 'standard' IDX file with the symbol set for system vectors, variables, and IO addresses that I currently use. This set is a slightly upgraded version of the one used in my older sources.
(As in the the STNGDEVP file I mentioned in an earlier post.)

Ronald Andersson wrote:

> Unfortunately this does not work correctly.

Nightmare!
I tested before I wrote that story.
I now tested also with Magic 6. It works.
edited namW[169] --> namW[0],
loaded, added 2 names.
All names look good.
and saved.
Output nicely back to namW[171]
I have TT030 4Mb STram 4Mb TTram. TTM194, NVDI 5

I have always lots of memory available,
so I have a look at all the malloc's, to check the checks.

I can have a quick start.

> I'll send you a suitable test program, with source of course, shortly.

OK.

> I will also include my latest 'standard' IDX file with the symbol set for

I used the Sybex Atari TT profibuch which I think as for the names is based
on Atari and DRI release doc.s.

> This
> set is a slightly upgraded version of the one used in my older sources.
> (As in the the STNGDEVP file I mentioned in an earlier post.)

Yes Thanks.

Henk.

P.S.
Keep searching for doc's

[Heavoc]

A few questions:
Is all well if you disassemble without the namW?
Are you sure you didnt inadvertantly corrupt the format of the indexfile?
Do you have lots of memory free, more than about 3 times the size of the object file,
after loading TT-Digger, before loading your program ?
(I checked the malloc's but one never knows)
Could you retry with the unzipped version in the folder TTDIGGER on my homepage?
Does the file you disassembled has these long names?
What does the journal say the format is? (Pure C -- DRI) Try w/o indexfile.

Regards

Henk.

Please elaborate on this a bit...
You mean it's possible to solder metal pins to SIMM's (what type?)
and put them as SIPP's in the STacy? (That's what I'm planning to do)

Thanks,
Robert

Bonjour,

J'ai fait un site sur l'Atari ST qui regroupe pleins de jeux, les derniers
�mulateurs du m�ment, des utilitaires pour votre ST et bient�t un peu
d'histoire sur la firme Atari et sur cette superbe machine.

S'il vous plait dites moi ce que vous pensez de mon site. tout vos
suggestions sont les bienvenues.
Merci de votre aide :-)

Hi Ronald

I start a new thread because the stuff indents out if sight ;-)

I mmanaged to get my Magic stopped with a memoryblock violation error.

I fixed this.
It is on my webpage. Same filename TT54C.ZIP
It is also in the folder.

I added a message, so there is also a new RSC file.

The story about exponentially extending tables , allthough nice, didnt reflect reality.
It was more what I would call "wishfull remembering" :-)
This means: I thought I remembered implementing this. In reality I only considered implementing, but didnt do so because of technical problems in this particular case.
I did such a implementation however in another program.
Hence the confusion.

This is the real story:
I read the number, if it is below a usefull value, I replace with that value, then double it. So each time you load a indexfile you get at least as much room to add names as there are already.

That means that a table can become full. There comes the message.
If this happens while adding interactively, just save IDX and reload again.
TTD still writes the actual number of names to the index file.

There was a little bug in checking for table overflow.

I could find this bug by lowering temporarily the "usefull value".
Conclusion:
If you dont want to know use a sufficiently high value, not zero.
I did that originally in the MEMIO.IDX, where I put in 255.

Greetings.

Henk

P.S.

Producing config files that can be read by a human being is nice and platform independant, but has a certain danger.
It is very tempting to fiddle with it. ;-)

Sobre, efficase, presentation sympa !!

Tres cool !!

Neanmoins une rubriques demos avec les bonnes vielles demos de la bonne epoque serait la bienvenue pour une machine comme l'atari ST !!

hello,
Yes it's quite easy.You have to find two normal 30 p 1MB SIMM's, as small as possible.This shouldn't be a problem, costs 5 Euro's ??
Then you solder metal pins from iron wire to the contacts of the SIMM's .These SIMM's should fit in the SIPP compartment.
Any good electronic shop should have useful metal pins or wire.
So you have for very little money your 4 MB.
Good Luck !
Jos
PS.I got a bigger problem with my intension to expand STRAM in my TT030....Still it's possible.A fellow from Canada will unsolder 16 chips from 2 X 72p.4MB SIMM's and put them on the 2 MB daughterboard of my TT , well that's a tricky case which I don't try myself !

But he has done it 2 times with 100 % success, so...............

I bought a falcon 030 6 months ago, it works perfectly, only problem is when I try to synthesize speach. When I enter the sentance or word to synthesize the speaker lets out a dim scratching, and doesnt appear to output any speach. I have tried hooking headphones up, but I get the same result. I wouldnt mind re-installing this machine because the previous user left a ton of stuff on it, and starting from scratch might help. if any one can provide any insight to this, I might be very happy to get back to my atari hacking :)

Hi

I'm after the above editions of Atari ST Review to complete my set of mags.

I would like to get the binders for them, I have the grand total of 1 STR binder and would like to bind them all.

Any help will be more than appreciated.

Most editors must do very unsophisticated things with the above.

> $08 = BS = Backspace

Are there editors that really do a backspace when they find this in a
file?? Delete the BS and the char preceding it. ?

> $09 = HT = Horizontal Tab

Saves a lot of disc space.

> $0A = LF = Line Feed
> $0D = CR = Carriage Return

Aaah these good old typewriter times. :-)
The sounds must exist in the famous "crazy sounds" accessory.
Should really have been "record separator"

> $7F = DL = DeLete   NB: this code is not less than $20 !

This is a funny one. It is a relic from papertape times.
If you made a punch error, you could erase the error by punching ALL
the holes in the tape row, hence $7F. So everybody!!! do not use this
for "overline". :-)

Greetings.
Henk.

I have used them too, but I don't know if I'm _very_ old.
I'm not even halfway through my first century yet... ;-)

>> $00 = NL = NUL anciently 'filler' code, nowdays C-style string terminator
>
>Most editors must do very unsophisticated things with the above.

Yep. This is one code that most programs won't allow the user to enter.
The main exception from that rule is binary editors like HEX_EDIT.

>> $08 = BS = Backspace
>
>Are there editors that really do a backspace when they find this in a

Actually I have seen some that processed input files exactly as if they were input from keyboard, with exactly the result you mention. I don't know of any modern ones that do it though.

>> $09 = HT = Horizontal Tab
>
>Saves a lot of disc space.

It sure does. (especially for assembly sources)

>> $0A = LF = Line Feed
>> $0D = CR = Carriage Return
>

I'm not sure exactly what you mean here.
The ascii code for "Record Separator" (abbreviated RS) was $1E, though I doubt if it is still used as such by many programs.

>> $7F = DL = DeLete   NB: this code is not less than $20 !

For sure ! We must prioritize paper tape compatibility !!! :-)

But now for something completely different:

I've been meaning to switch to TTDIGGER as my main disassembly tool, but I find that I can't quite adapt its output for DevPac compatibility.

The main problem is that negative absolute word references are expanded as only four hex digits. So a reference that was assembled with the constant $FFFFFA01.w is disassembled as $FA01.w, which DevPac will then interpret as meaning $0000FA01.w .

That will not assemble properly, instead generating an error message, as the long value $0000FA01 can not be properly expressed in signed 16 bit format. So I get a "data too large" error and a failed assembly.

The general rule for DevPac is that all constants and intermediate values are treated as longs, before operators are applied. So a constant will only be treated as negative if bit 31 is set, even if the constant appears in an expression that will be truncated to 16 or 8 bits in the object code.

I think this motivates a new format switch for TTDIGGER.CFG, possibly two.

The first one would select whether or not negative values should expand as presently done (for PASM I assume), or if instead some DevPac compatible format should be used.

The other could be used to choose between different formats that are compatible to DevPac (both are also compatible to PASM).

The format I prefer is to expand such constants to the full length of 8 hex digits, since that also makes it very easy to recognize I/O port addresses etc, normally defined that way in DevPac libs.

Another useful format is to expand such constants as "-$" followed by the hex digits needed for the negated (positive) value.

The former format is superior for expressing negative absolute addresses, but the latter format is better for negative offsets, and it would thus also be practical to enforce this different usage in the disassembly.

That would IMO eliminate the need for the second switch.

```

yes I've just had to do this with a giant midi file database with
thousands of entries, a bit long winded but I generated a print to disk
report for each field,then in a text editor removed the page nos and
other stuff that db sticks in,then I could import the texts as fields
into other databases

I have a MegaSTe with 4mb memory, and a 48Mb HD.
I bought a color monitor today, and I want to test all those games and demos...
But it seems that most of the games from the "Automation Collection" don't like the Tos 2.06.
I have more bombs and black screens than ever!
Even on 8Mhz and the blitter off, there's no way to start a game on this thing!!!
(yeah yeah: ok, four or five games are working ok...)

Is this normal: I mean: with an emulator on the PC, I get more games working perfectly than on the Atari!!!! (WinSTon) Even with the Tos 2.06!!

Can I boot the Atari with an older Tos on a disk, and does it help?

Help!!!

It normal. PC emu's make an allowance for system crashes.

>
>Can I boot the Atari with an older Tos on a disk, and does it help?

You can try it, I found it a little touch and go at present. But has a
good success rate using STE's. Only good for programs that can run from
the desktop!

Nope.....between 4Mb and TOS2.06, you're pretty much done I'm
afraid.....get hold of a nice bland 1Mb STFM or STF ..... will cost
peanuts...I did it and have never regretted it....:-))

chrisc
Normally a Nemesised Falcon, a TOS2.06 4Mb STe and a TOS2.06 STFM...but a
1Mb STF and a 0.5Mb STFM kept for games and demos....

AFAIK all you have to do is hold down Alt while you type the ASCII code,
and the character should appear when you release the Alt key. But
remember that these low-ASCII characters depend in part on the font in
use, and also are likely to be stripped by some comms programs.

It would have eliminated the confusion about cr/lf combinations.
In effect a few of the under $20 codes have a meaning in this context.
Pure C HELP uses group seperator (GS,$1D)to indicate a clickable word which it then
displays in bold. A sensible use of such a code I think.

In fact, we may well do so. Paper tape was a 7 bit binary code, this in contrast
to
punched cards. I am not sure, but it could well be possible that this papertape
code is the origin of ASCII. (I started my carreer on punched cards, which had
the advantage that you could also use them as fiches on which you designed
your computersystems.:)

Greetings.
Henk

[Snipped description of oddity]

Surely it is not the purpose of this post to comment on the behaviour of
DevPac. ;-)
One has to live with that, I think.

> The format I prefer is to expand such constants to the full length of 8
> hex digits, since that also makes it very easy to recognize I/O port
> addresses etc, normally defined that way in DevPac libs.
>

Yes.

> Another useful format is to expand such constants as "-$" followed by the
> hex digits needed for the negated (positive) value.
>

NO. Absolute word addresses are NOT negative numbers.

Do not forget what the .w means!!! It is the addressing mode of the <ea>.
A 16 bit value that is the absolute address.
TTdigger uses .w only for this purpose.
It is not a conveniently chosen representation.
So the only concession I am willing to make is mimic the behaviour of the CPU
on this addressing mode: Do the sign extension.
$FA01.w --> $FFFFFA01.w

> The former format is superior for expressing negative absolute addresses,

See comment above.

> but the latter format is better for negative offsets, and it would thus

Negative offsets are already displayed like that.
-4(a6) or -$0004(a6) (No .w there)

TTdigger used in hex always uses the exact number of hex digits that are
actually in the input. A 16 bit value is displayed in 4 hex digits, a 8 bit
value in 2. Tries to be as exact as possible.
Hence "concession" :-)

Greetings
Henk

Hello,

Due to an internal IP-address change at the Military Academy in Belgium
the address of the Belgian FTP site has changed.
It now is impossible to connect to the server using the old address
193.190.205.13.
The new address is : 193.190.204.128
The directory is : atari/
A DNS name will be available in the near future.
In the maean-time we also changed the hard- and software of the server.
It now is y2k compliant !
Martin "Nightowl" Byttebier and I are checking out everything now and a
big update of the entire atari/ directory will happen in the future.
Don't expect any new software on the server the next week.

THX for your support.

Greetings,

I'm curious about this. Using TOS 2.06 with a TOS switcher on my STe, even with 4 megs of Ram, I would have to say that by far, the majority of games work just fine...(original TOS 1.62)

It is there.

Propagation of bit 15 in .w operands.

On my home page: http://people.a2000.nl/hrobbers/Homepage.html

If my comment on DevPac sounded harsh?

Please consider this:

A generalization is nice, but must stay within the set that is explicitely stated.
In other words: truth must not diminish.
See .w as a cast which has maximum strength.
By simply having .w in one of the terms, all arithmatic is forced to be done in 16 bits.
So a human being doesnt need to type 4 f's of which the human being knows that they will be discarded in the end. :-)

This kind of computer software behaviour is invariably cause of maximum frustation.

Greetings.
Henk

Anyone with an XHDI compatable driver like HDDriver for
instance can park any scsii drive, powerdown to standby mode
any ide drive and eject any removalbe media that support the
industry standatd command sets. I hardly ever turn off my
Magic 6 Falcon - I simply hit F2 which runs XDHI with the
commands to park all my drives (ejecting those that it can).
On shutdown u should be able to do the same ... It would
prob require a script or a program though :(

I think you may find a lot of programs screw up on 4 meg. This is not
because of the memory but because programmers
as sloppy and write past the end of physical memory (into ROM).

On a 1 and 2 meg machine this is ok as the memory beyond is still video
memory and so will not cause a crash.
I have the same problem when running some demos, I usually have to
disassemble the code and fix it to make them work.

My Mega Ste had TOS 2.5 originally. It also came with a 720k disk drive. I bought a high density upgrade kit from a retailer in the U.S. The kit included TOS 2.6, a high density drive, and another chip that might have to be replaced (can't remember which chip). It's been years since I did the upgrade and don't remember the details about the installation.

I've heard that some Mega STe's with TOS 2.5 will format high density drives.

I just got a STacy (three hours ago), so since I've never actually *used* one these before I have a couple of question...

1. It takes somewhere between 5 and 10 minutes before the backlight starts working. Is this normal, or is my backlight dying?
2. I can't partition or reformat the harddrive (Conner 3020), both HD-Driver and HDX fails. Why?
3. It only has 1Mb, so naturally I tried to locate the SIPP-slots it's suppose to have. I removed a couple of metal-lids, but I could only find two ROMs and some RAM-chips soldered directly to the motherboard. Where are the SIPP-slots? Does it even have them? And if not, will a MagnumST work?

Hello all

First many thanks to all those who answered my question. It helped some!

By flipping dip switch 7 I made the format menu on my megaSTE (TOS2.05 France) offer the HD drive option. Now the problem is gettong the drive to work. The HD drive I have has 2 jumpers, and I tried everything with these, including data cable upside down. So far nothing worked ! Any more ideas ? (maybe I should check the drive on a PC or on the Falcon ?)

Keep the Fuji alive !

A way to test this is an emulator. (Winstone) You can choose the amount of memory.
Most of the existing games works ok, but the demo's wont even start...

You're right.
I found out a way to run the most of the games: to switch off the STe and
put it on again with the "ALT" key holding. (and of course the disk in the
drive...)
A reset isn't enough to make it work.
When I reset the STe insteed of switch it off, the machine boot on the
harddisk, even with the "ALT" key holding....
This is strange, switch on and off all the time, it can't be good for the
hardware!!!

That it would have, but unfortunately it was never consistently used as such.

Instead the Unix group went for LF, CPM went for CR+LF, and many of the minor 8 bit systems went for CR. I think Atarians inherited CR+LF from CPM thanks to Digital Research. They also affected ancient PC-DOS in that way at first, but then m$ adopted CR instead but never used it consistently.

In other words: Pure Chaos !

>In effect a few of the under $20 codes have a meaning in this context.

Interesting, I didn't know they used that. Yes, that makes sense.

----- snip ----- re: Paper tape code compatibility to ascii

>In fact, we may well do so. Paper tape was a 7 bit binary code, this in
>contrast to punched cards. I am not sure, but it could well be possible that
>this papertape code is the origin of ASCII.

AFAIK that is indeed the case, although there were also older paper tape types that used fewer holes, and thus needed reserved codes to shift between some different code/character sets.

>(I started my carreer on punched cards, which had the advantage that you
>could also use them as fiches on which you designed your computersystems.:)

I've never worked with punched cards myself, although I have seen them in use. They are definitely the oldest computer media, as they were invented well over a century ago (near 150 years ago I think).

Hi Henk,

on Sat 08-05-1999 22:13 Henk Robbers wrote:
>>
----- snip ----- re: my planned switch to using TTDIGGER for disassemblies

In fact I have planned to switch to it ever since I first tried it, because the speed is quite impressive and (even more important) it is the only such tool I know of which is still actively supported.

>[Snipped description of oddity]
>
>Surely it is not the purpose of this post to comment on the behaviour of

>DevPac. ;-)
>One has to live with that, I think.

Actually I like most of DevPac's behaviour, though some of it might benefit from an overhaul. But we do have to live with it as-is now, since it is no longer being developed further.

----- snip ----- re: 8 hex digit format for negative addresses
>
>Yes.

Good, because this is the important one for me.

>> Another useful format is to expand such constants as "-$" followed by the
>> hex digits needed for the negated (positive) value.
>>
>NO. Absolute word addresses are NOT negative numbers.

Not all of them, of course, but some of them are. That is how Motorola have defined the 680x0 address space. According to them addresses are signed quantities, with the usual wrap-around effects at overflow.

So $FFFFFA01.w is exactly the same as -$5FF.w, and both will also be assembled correctly by PASM as well as DevPac. I have used both forms at various times, but I prefer the long form.

>Do not forget what the .w means!!! It is the addressing mode of the <ea>.
>A 16 bit value that is the absolute address.
>TTdigger uses .w only for this purpose.
>It is not a conveniently chosen representation.

I know. It is the assembler equivalent of a 'typecast' in C, except that the effect on object code is more direct.

>So the only concession I am willing to make is mimic the behaviour of the CPU
>on this addressing mode: Do the sign extension.
>$FA01.w --> $FFFFFA01.w

That will suit me just fine.

>> but the latter format is better for negative offsets, and it would thus
>
>Negative offsets are already displayed like that.
>-4(a6) or -$0004(a6) (No .w there)

That too suits me fine.
I only mentioned it so that you would not misunderstand me, and think that I might want the long format for all negative numbers. That would not be good.

>TTdigger used in hex always uses the exact number of hex digits that are
>actually in the input. A 16 bit value is displayed in 4 hex digits, a 8 bit
>value in 2. Tries to be as exact as possible.
>Hence "concession" :-)

I see what you mean, but I must add that in this case the concession is an absolutely necessary one for compatibility to DevPac, as the form presently used can not be assembled by it.

This is not normal at all. But the light will never go very bright at all. I tend to use an external light source instead.

>2. I can't partition or reformat the harddrive (Conner 3020), both

My Conner 3040 (40MB) does not like AHDI 6.61 at all. It bypasses the autofolder but loads .ACC-files. Strange. The old AHDI 3.01 from 1989 works perfectly. I don't have HD-Driver.

There does not seem to be any problems with AHDI 3.01 . I been using it for many years with delayed write cache (TCACHE64) enabled and never lost a file.

Mine is also 1MB. It has a special memory board with soldered RAM. To expand the memory the "official" way you will have to get another memory board. I managed to fit a "ExtraRAM Deluxe" expansion kit in my Stacy. Some soldering was required and I placed the SIM board partly in the battery compartment.

Yes, and for normal ST's the same thing can be done, though it takes more work to install TOS 2.06 there. In any case there is no doubt that the best TOS for general game/demo use are TOS 1.04 for ST and TOS 1.62 for STe.

But in this case the poor guy has an MSTe...
So the big question here is: "Can an MSTe boot properly with TOS 1.62 ?"

MSTe has a lot of new hardware compared to a normal STe, so it is not a good idea to use TOS 1.62 on an MSTe for serious work, even if it does boot correctly, because I am sure this would block many things from working right. (Mainly SCC ports and RAM cache.)

But for games that would not really matter, just as long as the booutup behaviour is similar to that of a normal STe. But does it work that way ?
I have no way of testing it. Will someone else volunteer to do it ?

Great. I'll download the new version in my next online session then.

>If my comment on DevPac sounded harsh?

Naah, opinions differ, that's only natural. Since I know that you prefer PASM, you naturally prefer its methods of doing things.

>Please consider this:
>
>A generalization is nice, but must stay within the set that is explicitely stated.
>In other words: truth must not diminish.
>See .w as a cast which has maximum strength.

But the very concept of a 'cast' and its operative priority, is specific to the C language. PASM has a relation to that, but DevPac does not. So while I do see what you mean, DevPac was just not designed for it.

To DevPac longwords are the only existing data type for numeric variables and for intermediate calculation results, and no forcing typecast exists. To it, the 'xxx.w' simply means that the preceding xxx expression should be tested to see if its signed long value will fit in a signed short word. Any expression in the range $8000..$FFFF will fail these criteria.

Both the PASM way and the DevPac way of doing things are equally logical, but based on different ground rules. It is much the same with humans. We can't fully evaluate the logic of someone elses actions if we are not aware of his basic premises.

>By simply having .w in one of the terms, all arithmatic is forced to be done in
>16 bits.
>So a human being doesnt need to type 4 f's of which the human being
>knows that they will be discarded in the end. :-)

Right, but that kind of redundancy is still a factor in easy recognition of stuff, as implemented by human brains. It is a lot easier to recognize a reference to (for example) $FFFFFA01.w as an I/O port access, than to do the same with $FA01.w, since the latter is visually so closely releated to other non-address expressions in a source code.

>This kind of computer software behaviour is invariably cause of maximum
frustation.

Frustration is inevitable. A computer language is a fixed set intended to model some of the things humans express in their thinking. But human thoughts and even our languages are not fixed in that way. Thus frustration with any computer language is to some extent inevitable. It is just a matter of time before something we did like in an earlier situation appears intolerable in some later situation.

>(Not English, and not a mathematician, but I hope what I want to say is
>nevertheless clear)

I had no problem understanding you, so don't worry about it.

There have been a couple of postings here which have confused me a bit. Is it possible to add more RAM to my 1 Meg STf (I think it has TOS 1.0)? Also, how much can I expect to pay for another meg or two of RAM?

Thanks

Chris

Hi;

I've got an SM124 and STF both in excellent condition I would let go for $US200. I've also got a 32Meg SCSI hard drive with ADSCSI adaptor card I'll sell for an extra $100, and a Star NX1001 printer I'd sell for 75. If you've got a good (audio) CD Recorder, I'd consider a swap.

It's possible, but a little bit messy and expensive, as it requires an extra upgrade board. You should contact your closest dealer for prices, since you seem to be located in Canada.

I found that it was cheaper to get my hands on an STE (these use SIMM memory) and upgrade that with standard RAM.

This is all detailed in the Quick FAQ.

Nick

You have an external hard drive, right? Well, if you know you are going to play a game, just don't even start it up. That way, the hard drive software won't be loaded up, and you won't have to do an <alt> or <control> (control just passes up all auto folder programs and ACC's). With a floppy in the drive, your ST will search there first with the HD turned off. Hmm...are you using HDDriver software by any chance? I'm not sure but it seems to me that you can set boot preferences with it, so that it looks and tries to run a floppy *before* the hard drive. Might look into that... Hope this helps some! ;-)

Once it lights up it gets rather bright, I have no problems reading it
regardless of external light-sources. But I have to look into that delay.

The following is based on my experience with my STacy. If anything is not clear feel free to e-mail me for clairification.

Others will tell you to take apart the screen cection in order to have more room to work but I prefer the "keyhole" approach:

1) Remove the 6 screws from the bottom and 2 screws from the back.

2) Carefully release the 4 clips that hold the keyboard section together (2 of them are located just above the handle mounting points, the other 2 are approx. 1/3 of the way from the front to the hinge).

3) Carefully lift the top half off while prying the face-plate arroung the eject button on the floppy.

You now have just enough room to move the to halves arround to get at what you need.

4) Remove the keyboard.

5) Remove the 3 screws at the front of the shielding and bend all the tabs straight.

6) Carefull remove the shielding (after removing the shielding I cut it back away fron the wires for the screen to make it easier next time).

7) unplug the internal powersupply from the motherboard.

8) unplug the screen connector from the motherboard and the screen grounding screw (it is one of the HD mounting screws) set the screen section aside (

Now you have room to work).

9) Remove the floppy, swap hard drives and put it all back together again.

The last time that I did this it took me 45 min but unfortunatally the drive
was dead so I had to remove it again.

I also have a spare memory board with 2Meg and 2 sip sockets e-mail me with an
offer and I will consider selling it.

my real e-address (the one that I can access with both my STacy and PeeCee) is:
davisent@SPAMperf.bc.ca remove the SPAM to get through.

Sincerly Stephen Davis

I think this is a hangover from teletype days, SI puts it into Shifted
mode and SO back to unShifted normal letters. Note that most teletypes
had two different Shift keys: One gave numbers and the other punctuation
marks IIRC.

I just got Pasm together with Pure C. I didnt need another assembler.
So its the only 68K asm I know :-)

> >See .w as a cast which has maximum strength.
>
> But the very concept of a 'cast' and its operative priority, is specific
> to the C language.

No. Casting is well defined in Algol 68 (also struct and union are from this
language). Morover casting is a process that every language, either high or low,
either implicit or explicit must be able to manage.

> Any expression in the range $8000..$FFFF will fail these criteria.

Motorola is a little bit ambiguous here. They let usability prevail theory.
Although memory addresses are unsigned numbers, you must treat .w operands as
signed numbers. That makes the following possible:
If all the bits you have to discard from a long signed number are the same as the
new
sign bit you can discard them savely, because doing so does not change the value.
$FFFF8000 is the same as $8000, $00004000 is the same as $4000.
This is true for both computers and the universe.
(If you regard 'long' in computers as inifinitely long ;-)

This means that such values fit. And although the treatment is that for signed numbers, their meaning remains unsigned. :-)

[snip]

Visibility: A point. I am working on the names of the Memory mapped IO.
I did not finish it but it is a start. It would be nice if more than 1 person can add to this list at convenience. I'll send you this later.

What is simple for a human can be extremely difficult for a computer.
Nevertheless there are things that are equally simple for both computers and humans.
Computers dont have the right to let you down in these cases.

Greetings
Henk

It will be supported as long as I can use a M68K computer or emulator.
1. I use it myself quite often.
2. It's fun.

> Actually I like most of DevPac's behaviour, though some of it might benefit

Is it true that it is a good and complete development system? editor, make, cross reference etc.

Ah! Thats how they behave. But is it also their meaning?.
Exercise:
You have all the memory you can have (4Gig). Fill it with NOP's and
start the processor anywhere. If it loops forever, you're right.

> It is the assembler equivalent of a 'typecast' in C, except that

A bit a chicken and egg question.
I would say: it's a field descripter (or a type) that may result in a cast when initializing.

> The concession is an
> absolutely necessary one for compatibility to DevPac, as the form presently
> used can not be assembled by it.

TT-Digger likes it to be used.

Henk.

Ok, I've now tested the new version.  It works fine as far as I can tell.

I disassembled a small prog doing direct I/O port accesses, saved the source,
and reassembled with DevPac.  Picked up both original prog and the new one
and dropped both on egale (set for binaries as default).  This proved that
the two programs were byte for byte identical.

Terrific !  You can chalk up another convert Henk !

On the hardware level there is no such thing as signed or unsigned
addresses, only a bunch of signals that can be interpreted arbitrarily.
Signedness is purely a software concept.

Why do you prefer this to a proper dismantle procedure?
Two screws behind the sticky Atari Stacy Logo inside enable unclipping
the very top cover and gives easy access to hinges and screen
connections which come up through the hollow hinge. Spring tension is
low if you undo hinge screws whilst the screen is open. Careful
feeding of these through there allows complete removal of the screen
assembly and then of course the top will come right off.
My Stacy 2 has a special memory board with chips soldered and 2 simm
slots. Obiously there are many configurations!
Cheers for now Bryan

Sorry, but I have a :

FTP Error

Could not login to FTP server

When I try to connect.

Is there an address problem ?

Hello to everyone

I'm trying to compile a Linux-Kernel in order to get some modules working, which I don't have in the kernel that I loaded down from a linux-site.

I've got a Falcon with 14 MB Ram and I'm also able to compile the 2.1.131 kernel, so development-environment is okay.

When I compiled the kernel and boot it with ataboot 3.3, which gives me the same bootinfo as the kernel has, I get some pixels on the screen, changing rapidly and the printer prints something about a colour dummy device, but nothing like Atari builtin, as the kernel which works does.

Anyone can help me by sending my their Makefile and .config together or just telling me, what I'm doing wrong.

Thanks a lot

Andreas

Yes there is a problem with the Belgian ftp-site. I couldn't
login either. The main problem is that the webmaster seems to be sick now.
I hope he will be recovered next week so he can finish his job.

CU
Martin

Hmm, everything seems OK here... I can login without any problem.
Did you already try it without specifying the path atari?
Maybe that last / can cause the problem...

Ahh...but aren't some of them like the BMS drives where you had an
ACSI-SCSI board followed by a SCSI-MFM/RLL (dunno which)
board...incidentally if anyone has the drivers for the BMS-100 Mk2 (or any
BMS driver software) I'd like a copy...I have one of these archaic old
horrors and want to see if it works.....all normal software, even Uwe's
wonderful(just solved a major wierdness problem on my Falcon's 4Gb drive
only adressing 3Gb with HDDRIVER 4.61) stuff, just bounces off laughing,
bombing out or crashing....

Hello everybody

I am the owner of the two following items : one mega STE and one HD floppy unit. I have read or heard that the megaSTE can handle HD floppy units without hardware modification (besides the floppy unit replacement of course). But I am not too sure about what is to be done, on the megaSTE unit (dip switches to move ou ?) and on the HD floppy (jupper setting, other hardware modifications ?

If any of you know abaout this, or about a site where all is explained, I will be gratefut.

Happy Ataring !

Stephane Montarsolo

 I can`t answer your question but I might know someone who can.
 I was to Dave of the Upgrade Shop (TUS) (details to folllow) about
 the Veloce (details:- upgrades a STE to a 68020 processor at 16mhz,
 0, 2 or 4 mb fast Ram of zero wait state, at 32 bit, switchable
 between standard and upgrade.) anyway he was telling me about some
 project he was doing. Which was to use programable chip (because of
 copyright) to make a bootable system to run stright into Cu-base for
 some customers.

  As an old XL user myself it does seem a bit of a wast of a port not
to be used (well only for music). I`ve only move up to the ST in the
last 8 months, started with just a 1meg STE now have 4meg (wiating the
Veloce +4meg) the 1gig HD, CD-Rom, ext. ZIP drive. Color and Mono
Monitor. Just the start of my main system, wait tell I get more space.

My old XL was expanded to 256k, 2x PIA chips (for an extra 16bit control port), 2x POKEY chips. I had design an circuit with the control of the 2nd PIA chip it could take up to 4 Meg, in thery.

if you don`t have any joy then e-mail me and I`ll contact hem for you but beware his very besy.

I`am tying to transfere files from the Xl ver the 850 in to the serial port of the ST, do you know (or know of any one, email) on how to contect the 1050 disk drive to the serial port of the ST.

Thanks if you can.
Hope you find the above of some help.

Karl

Need some help?????????????????
I`am tring to transfere some info from my old XL ver the 850 interface to the seril port on the ST.
But I`ve heard the 1050 (5.25 disk drive D/D) can be connected to the serial port of the ST, can anyone tell me how.

Thanks.

HI,

Does anyone know how to use and program (what software) the 15 pin
control port on the STE to control and monitor external devices.
Did use something on an old XL to control an Alarm system.

Thanks for anyone who can help.

>more info.

This is the place for such info, so you got that right.

>1> The OS seems to be GEM/TOS. How compatible is this with
>   all the normal PC DOS software out there?

Not compatible at all I'm afraid. The ST uses another CPU type, similar to early McIntosh computers, and the OS is not at all similar to PC DOS. Emulators exist, but are extremely slow, except a few based on hardware boards, which are expensive.

>2>There is a plug for an external hard drive. Is this Atari-only,
> or will a generic HD do? (Any cards necessary?) Also, can they be found,
> and how much would they cost?(Someone has asked.)

The hardisk interface is an Atari-specific standard named ACSI, which is somewhat related to SCSI, but it does require a so-called host adapter to allow connection of standard SCSI drives. They can be found, but I am not well informed on current prices. Alternatively you can look for the Atari Megafile drives (now available secondhand only I think) which can be connected directly to the 19-pin ACSI connector.

Note also that even a small drive will go a long way for Atari systems, since applications do not waste space as much as they usually do on PCs.

3> Is the 1224 monitor like VGA, SVGA, or what?

SC1224 is a colour monitor that needs signal timing similar to that used in television sets. It can handle both european PAL and american NTSC timing. It can not display VGA or SVGA signals at all.

>Is it compatible only with Atari, or could it be converted (plug conversion)
>for use with a PC or MAC?

No, it is not suitable for use with other computer systems, except possibly other systems that used monitors with 'TV-like' signal timing, such as many gaming systems have done. Such use will require a custom made adaptor plug.

4> Can Windows 3.1 be run on the system, if someone really wanted it?

Sorry, but no way! No emulator can be fast enough to handle a system so inefficient as windows on a machine of this kind. It only has an 8 MHz CPU you know.

>It looks like GEM/TOS might be resident in a chip.

Yes, that is so. It is also possible to load replacement TOS from disk, however, and that's the customary way of loading multitasking TOS versions.

>Sorry if these seem elementary questions, but my experience has been
>strictly PC.

No excuses are needed.
If all people were identical, only one would be needed !

And then what would the rest of us do ?!? ;-)

>I really like what I've seen of this system so far,

Yes, it is quite nice, especially when you consider its age too.
It is quite amusing to see microsoft claims of recent years that
they contributed in any way to development of modern WIMP systems,
when Atari and Apple had them long before microsoft got involved.

>but can't answer the questions I've been given, and have been having
>trouble finding information. Thanks for ANY help you can give!
>   Bette F.

I hope you find some of the above useful.

> external hard drive. Is this Atari-only,

Yes.

> or will a generic HD do? (Any cards necessary?)

Not a card needed, if you can find the right HD
Read this NG for a while and look out for the term "MEGAFILE"

> 3> Is the 1224 monitor like VGA, SVGA,
Not sure, never had that one. I think it is a RGB monitor.

> 4> Can Windows 3.1 be run on the
> system, if someone really wanted it?

No.
Atari runs it's own window system, which is completely held in, and running
from ROM chips.

> I really like what I've seen of this
> system so far,

That is nice.

> but can't answer the questions I've been given, and have

As I've said several times before I get perfect results with STinG and
Freeserve, in fact it's got better if anything.

An email will result in a copy of my scripts for Freeserve.

> more info. 1> The OS seems to be GEM/TOS. How compatible is this with
> all the normal PC DOS software out there?

It isn't. It's like Mac and PC, 2 different things altogether. PC DOS
bloatware is not something I would call "normal", BTW.

2>There is a plug for an
> external hard drive. Is this Atari-only, or will a generic HD do? (Any

> cards necessary?) Also, can they be found, and how much would they cost?(Someone has asked.)

You would need a SCSI drive, and a special SCSI host adapter, or an Atari HD. This is all detailed in the Quick FAQ.

> 3> Is the 1224 monitor like VGA, SVGA, or what? Is it compatible only with Atari, or could it be converted (plug conversion) for use with a PC or MAC?

The 1224 is an RGB colour monitor. It's more like a TV display than a VGA monitor, you could hack it to connect it to 8-bit computers or an Amiga, but not to a modern PC or Mac. It can only display 200 lines horizontally.

> 4> Can Windows 3.1 be run on the system, if someone really wanted it?

Nope. What use would that be anyway ? That would be missing the point of owning an "alternative" computer. If you want to run Windows, you should get a 486 or something. The ST is something different. Although it's far less powerful than a modern PC, the software that runs on it is the opposite of the PC's bloatware, making it just as useful, and easier to maintain.

> It looks like GEM/TOS might be resident in a chip.

It is. That way you can't mess up the registry or your DLLs. Whatever you do, you'll never lose the OS, and it boots in seconds instead of minutes.

> Sorry if these seem elementary questions, but my experience has been strictly PC.

You might want to check out the Atari ST Quick FAQ for more information.

The text files that are in the Quick FAQ will help you.

http://www.multimania.com/bales/text/hdfloppy.zip

First of all you need to set all the jumpers (if any) on the drive as described in those files. If it doesn't have any jumpers, then you'll be looking for solderpads or some other tricky way to configure it. Most of the time, it's a matter of guessing. You have to change the drive ID number from 0 to 1, set media change detect to on, and figure out a way of getting +5V onto pin 2 of the connector when a HD disk is inserted.

The Mega STE needs no configuring. The dip switch setting will just add a "High Density" option to the desktop formatting menu. You don't even need to do this if you use a different formatting utility. The text files I have say it's jumper E6 on the STE, which makes it dip switch number 6 on the Mega STE.

The Mega STE should have an internal high density drive as standard!

Hi

I've not come across any software that will do this, I tried about 7
months ago for someone.

I may do it manually if you like, taking for granted I have a database
that you want on the PC!

You hold down the [ALT] key and on the numeric part of the keyboard type
the ASCII code of the character you'd like. It should be in the range
32-255. A printed ASCII list at hand is useful.

I had to do that a long time ago. As I recall, I had to generate a
report and have it print to a file.

This may be none of my business Derryck, but perhaps you should emphasize
that some scripts have been updated (as result of our c.s.a.s thread).
Otherwise some people may miss it, thinking they already have gotten
the best from you earlier.

I'd suggest adding something like "(updated May 3 1999)" when you mention
your scripts, so people can be sure they have your latest versions. That
could be important to some users.

I don't think it is so much a case of 'missing' the words as of how
to interpret them. No matter what interpretation I use, it seems as
if you meant that TOS 2.06 is more or less directly derived from
TOS 1.62, which is definitely not the case.

TOS 2.06 is AFAIK a direct port of the TT TOS 3.06 for the ST and STe
hardware. This makes it the best TOS available for all serious work
on ST/STe machines. I think that the only things imported from TOS
1.62 are the drivers for STe specific hardware. Even that may not
need to be true, since most of those exist in TOS 3.06 as well.

Hmmm, I guess some blitter code may have come from TOS 1.62 (or 2.05),
since the TT does not have any driver software for a blitter chip.
(TT only supports software blitter.)

Hi All,

I am using HD Driver V7.51 and MagiC 6 on a standard 4MB STE and was wondering if I installed Backgound DMA will it slow down the serial port?

Is it possibel to use Background DMA on a standard STE?

Gordy.

The Atari modem was 1200 bps I think.

Well, in that case, TOS 4.04 is basically TOS 1.0 rejigged for the
Falcon hardware, Windows 98 is basically MS-DOS rejigged for 1999 PII
hardware, and Linux is basically the ZX81's OS rejigged for modern day

workstations.

There are much more differences between TOS 2.06 and 1.62 than between 1.00 and 1.62 for example.

Curious:
Regarding an ASCII code set,
Other than what can be typed in directly from the keyboard without using
alt or control, are all the remaining characters used as control characters
or are they just considered control characters by an editor program?

That's something that I'm aware of - I've tried my best to make sure that
anything major that comes to light is publicised. I've already posted about
the necessity of adding the dial_scr line to NeST, and there is to be an

addendum published in the next Atari Computing magazine.

>Otherwise some people may miss it, thinking they already have gotten
>the best from you earlier.
Yep. I'm not sure that this is a problem tho', depending on where the script
came from in the first place of course!

One day I'm going to post the scripts on my web page which would make
updating easier for all concerned - again, they are Freeserve scripts, but
it's not that hard to convert to other ISPs with the changes I've made.

>I'd suggest adding something like "(updated May 3 1999)" when you mention
>your scripts, so people can be sure they have your latest versions. That
>could be important to some users.
A very good idea, there might well be some adjustments needed as a result of
the thread about background downloading with Dan's overlay!

I have some more SCSI Hard Drives For Sale

2.1Gb 60 ukp
4.2Gb 100 ukp

Prices include postage in UK, for elsewhere in the world an addition cost will have to be made.

It shouldn't but there are reports that in current versions of MagiC this is the case. Please ask Andreas Kromke, the author of MagiC, for more information.

> Is it possibel to use Background DMA on a standard STE?

Yes, it's possible on any standard Atari.

: >Well, the english docs say it's SCSI only... I might give it a try then.
: I'm on a falcon with a 63 and a 150 Meg HD if that's of use.

The latest version of CBHD (5.02, I think...) has preliminary IDE support (or actually SCSI emulation for IDE). Didn't work with my setup though, it would go all weird after recognising my IDE HD...

By the way, dows anyone know how to keep BigDOS 8 (both Falcon and ST versions) from skipping all other boot programs after it? It's a bit annoying, as it has to be run _before_ most other programs, and then skips them :(...

Hi,

Since last week one audio channel (output) of my Falcon stays very
quiet; the other channel seems to have no problems. The only noise out of
that damaged channel is a 'plop' after a reset or a power on.

The first time I noticed the problem was after I had been swapping cables
from my amplifier to my Falcon. So, if I connected a cable wrong, what
component would die first?

Also, I pushed in a FPU from a TT short before that. Could that do any
harm? I already removed the FPU, but that didn't correct the audio
problem, so I put it in again...

And I already checked the cables...

It's pretty hard to put together, as some games/software say that they
are STE friendly and end up not!!!

I ought to really make a note on unfriendly STE games. Very few games
fail after the protection it given a little lee way or run under the
disk based TOS 1.09.

As far as I know only codes (decimal values) 0 upto & including 31 are.
And they are only considered as such by console typewriter emulators.  :-)

Henk.

Aw, come on Henk, I know you know better than that... ;-)

There are lots of codes recognized by most ascii handling programs, though it is true that the origin of these codes is from TTY terminals. (And emulators of them too of course.)

Below follow some that are handled by lots of programs.

```
$00 = NL = NUL  anciently 'filler' code, nowdays C-style string terminator
$08 = BS = Backspace
$09 = HT = Horizontal Tab
$0A = LF = Line Feed
$0D = CR = Carriage Return
$7F = DL = DeLete   NB: this code is not less than $20 !
```

All of the above codes are very important in all kinds of text handling programs, including for example text editors and even web browsers.

As for the full range of 'control characters' I have always taken that to be $00..$1F plus $7F, giving a grand total of 33 codes.

All of these codes usually do have some font character definition too, but entering them so as to get that displayed can be tricky sometimes, and it usually does not give the expected result for the codes whose meaning I explained above. Most text rendering will use the defined meaning, and will thus not display the font character for those codes. That varies from program to program though, and also varies for different codes.

Hi

If you've been reading some threads, you will notice I'm having a tiny problem with getting my MO drive detected using HD Driver. I'm after borrowing s different DMA-to-SCSI host adaptor other than ICD Link II. I need to work out if it's the host adaptor or HD Driver itself!

Ideally I would appreciate someone in UK to aid my plight and I will cover postage costs etc...

Are you certain that you have the jumpers properly set on your hard drive, the ribbon cable properly installed and SCSI terminators installed on both the first and the last devices in the SCSI chain? Those are the usual causes of the system not seeing the drive. Other than that, have you tried using the ICD software drivers instead of HD Driver?

As I mentioned in a previous posting, I have tried EVERY combination
including the device on it's own.

The ICD software find it, no problems at all, but HD Driver doesn't:(
and I prefer HD Driver over the ICD one as I can move devices between ST
& pc!

Thisd message comes when no drive at all is found to boot from but
the system sees a drive in existance.
For instance:drive gets juice but does not spin up.
Or, in your case: you have to make a partition of the drive bootable
and put a harddiskdriver on that partition.
Mostly software partitioning a drive has with it software to do this.

>REALLY need to do this? What pins should be connected?

That depends on the purpose you need it for. STinG networks do not
need any handshaking as long as the speed is not too high, since TCP
contains flow control as part of its packet handling protocol. For
other purposes you will often need RTS-CTS handshaking too. On a port
that has handshaking inputs which are not connected to the other port's
outputs, you may need to strap those inputs to an 'active' voltage
'level' to avoid blocking the port. Usually this is done by strapping
to a corresponding output of the same port.

```
eg:  port_A             port_B
     ------             ------

     Gnd_A ------------ Gnd_B \
     RxD_A ------------ TxD_B  > These connections are always needed
     TxD_A ------------ RxD_B /

     RTS_A ------------ CTS_B \  These are needed for RTS/CTS handshaking
     CTS_A ------------ RTS_B /  Without handshaking they need straps

     DTR_A ------------ DSR_B \  These are usually not needed, but if present
     DSR_A ------------ DTR_B /  they need to be strapped as below instead

     Strap alternative for DTR/DSR lines
     DTR_A --+      +--- DTR_B \
             |      |           > Here each DSR is fed by the DTR
     DSR_A --+      +--- DSR_B /  of the same port
```

If RTS/CTS lines are present on a port, and you do not want handshaking,
then you can let RTS feed CTS, to ensure proper operation. Just as
DTR feeds DSR in the DTR/DSR strap example.

For some purposes you also need DCD to be 'happy', and for that you need
to feed it the same signal as you use on DSR, which should be fed from
a DTR output, either from the other port or from the same port.

>This cable will be rather long, and I'd like to make it go from the
>Mega's MIDI port to the Falcon's LAN port.

That can't work, for two reasons:

1: MIDI uses a fixed bitrate of 31250 BPS, which the LAN port doesn't have.
2: MIDI does not use hardware drivers compatible with LAN port inputs.

MIDI should normally be used to connect to other MIDI ports only.
That is also the simplest way to connect any Atari computers, as
there is no need at all for special cables. Standard MIDI cables
are all you need.

If you need the Falcon's MIDI ports for a synthesizer, then you
have to use RS-232 for the network instead. If you also need
a Modem at the same time, then you are out of suitable ports.

Two solutions exist for this problem.

1: Buy an adapter that converts the LAN port to an RS-232 port.
   Use the new port for your network and the standard port for
   the modem.

2: Add RS-232 drivers for the (normally unused) Modem 1 port
   that exists inside the Falcon. Install a connector for
   those signals, and use that for your network. This frees
   the standard Falcon Modem port (Modem 2) for modem use.

Unless you absolutely _must_ have synthesizer control while the
network is active, I advice you to go for the 'MIDI to MIDI'
network type. This also gives better speed than the Mega 4

can manage on Modem 1 (that is limited to 19200 BPS).

```

Yes, this is possible.

Hi

I'm after any info on the STE ZIP upgrade board.

I've no idea on what it actually does! I do have a leaflet with instructions how to fit etc. But it sounds a bit silly sticking in a board that has 2 meg on it, into the 2 memory slots!!!!

What benefit or features does it do!! It seems to upgrade to 4 meg with this board you remove all memory, slap in the upgrade PCB things and put this other 2 meg on the ZIP board itself. It does seem to be a little silly!!!!!

I've tried the number on the leaflet and I go the usual 'unknown number' message. The (c) is Go Direct Limited 1993, the tech support number is 0480 (before the 1 day, 01480) 891171

Ask your ISP if they're using PAP or CHAP modem protocols?
As I understand it there is no support for CHAP in STing yet.
You should try MiNT or Linux.

Well if you have the controller board already there (it was an optional
extra) then you need a 50-pin IDC cable...like the one on the floor over
there <points>

It might also be possible to run a SCSI output on your Megafile (so not needing the Link) as long as it is not an MFM/RLL based unit like the good ole 204

Too right, the cheap (but rather ugly wqay) is to power the drive directly
off a PC PSU and remote power the ST from the PC PSU via a PSU-Burtser
cable .....I sell PSU-B-ST cables for 8 UKP including postage in the UK.
   They've been improved since Joe got his review one for AC as
   well....they look nicer and now have a vertical entry..

Hummm...
I opened the case to see what was inside...
It doesn't look like a SCSI connection, as it has two smaller ribbon
cables going into the drive mech rather than one wide one.

I'd assume that's the old MFM/RLL?

I forget what the lable was on the drive mech, but it was a full height
Seagate thing...ST something or nother was the model number. I was hoping
it was a true SCSI mech...cuz I've a old 80meg SCSI mech with MintNet
installed on it that would really be nice in that Mega ;)

But it's good to see I can pop on a LINK controller as well. Might even
do the dual CPU on one SCSI bus thing and mate the bugger with my Falcon.
Which reminds me...anyone know if permiscious mode driver software exists
for TOS? Something that'd keep all the disk caches updated across the SCSI
bus so active systems could SHARE the same partition at once?

You need 3 leads:

receive----------------------transmit
transmit---------------------receive
signal ground-------------signal ground

The allowable lenght of your cable is limited. The longer cable the
lower transmission rate. I believe I could use 9m (27 feet) with 19.200
baud.
This was several years ago, so I'm not sure I remember it right.

You can't connect from the MIDI to LAN. Try Midi to Midi or RS232 to
RS232, or "Modem" to "Modem" in Atari lingo.

In the Sting Port Setup cpx "General" menu, do you have PPP selected and
saved? Without this setting, PPP will not work.

I don't have Sting Port CPX activated at all and I connect PPP OK!
But I do agree there might be CPX problem.

Newsgroups: comp.sys.atari.st.tech

Greetings,

I would like to somehow connect my Atari 8-bit computer
equipped with a ICD 1meg Multi I/O (MIO) to my Falcon so
that I can exchange files with them.
I would like to use the modem ports or the parallel ports
if possible. Which ever one works and would be the fastest.

I was thinking that some type of Null Modem cable would
probably work, not real sure on this.

Also if possible I'd like to have both connected and still
use the Falcon Online to the Net.

Maybe sometype of LAN cable to RS232 on the MIO would
work?

If anyone can give some tips on how to make this work
I'd sure appreciate it.

If some cables need to be made in order to do this, I could
use some text files or etc on how to make them.

Also, I'd like to make a LAN cable to modem for the
Falcon so that I can hook up a standard modem to the LAN
port. Any help on that is much appreciated as well.

Thanks,
phantomm@kih.net

I'm using HD driver v7.51 with an ICD Link II and I can't get it to see
an MO optical drive or one of my Pioneer multi CD changers; I couldn't
get it to see a PD drive either!!

I have even tried the devices on their own.

The ICD software detects them! But I want to use the DOS compatibility
mode that HD Driver offers.

Anyone got an idea! I've been fiddling for nearly 5 hours and getting  a
little ####### ###!

I've had a Milan040 since the New Year and I have experienced a few minor
but irritating problems.

The CD drivers MetaDos and MetaXBS seem to clash with the Milan
Soundblaster software.

If either of these drivers is active then no sound is output from applications
like GEMJing or Aniplayer. Has anyone else noticed this ?

The second problem is probably caused by something I installed but I can't
figure out what it is.

No matter what resolution I boot in, the desktop always starts-up in the same
mode. After the various AUTO programs have loaded the screen always reverts
to 640*480*64k, it used to be ST_High but after a lot of playing about it now
starts in the latter mode but refuses to register the res. I choose from the
menu. Does anyone have any ideas?

Lastly, has anyone tried replacing Mint with Magic on their Milan yet?

regards,

Peter.

In those times you couldnt bring a computer into a building.
You had to buy the computer first, then wrap the building around it.

Hallvard:

This is a little surprise to hear as I have been enjoying seeing the updated lists, knowing that they are updated and seeing your comments at the beginning of each post. So I (we) will miss that. However I can see it is a pain to do month after month, year after year, so I really appreciate how long you have kept it up. If you had NOT posted to the newsgrps, I would not have known there were any atari FTP sites, as your list started me on the road of FTPeeing (little pun).

So Thankyou again Hallvard....eh.... Harvard (inside joke)

How true!

I have insured my computers against thefth and fire for aprox 3 Euro a month.

Now my insurance company thinks I am a company that supplies energy to half of Europe.
Last week I got an offer for extra insurance up to 2.000.000.000,= worth damage to 3th parties because of the Y2K problem I must have.

Henk.

They are all about the same! The STE's do have games only meant for them; Obsession is one of them. And they are easy to upgrade.

Although there are many games that don't like the STE's, IK+ springs to mind, most fail at the disk protection. These are in the minority though.

My kids love playing on one of my 520STFM's, even though they have game consoles!!!

In the end it all comes down to personal taste and what you're usage for it is.

It's a bit confusing, but to set the resolution you want N.AES to boot
in, you have to save newdesk.inf in SingleTOS(!) (with the desired
resolution).

The next version of N.Chres will have a "save" button to avoid this
annoying "workaround".

> Lastly, has anyone tried replacing Mint with Magic on their Milan yet?

I don't think it's already out, but as the beta phase is finished, it
should be released in the near future.

Ciao

```

Try getting your hands on a STF1040 with 4MBs of RAM and TOS 1.0 with a
switch to 2.0.  That will cover everything for Atari games.

Why choose? They're so cheap now so you can easily afford
a couple of them. One 1040ST with the old TOS 1.0, and one
1040STE for games that utilize the extra hardware features?

Slight mistake there Jerry. No TOS exists with version code 2.0 .
You must mean TOS 2.06, but for pure gaming purposes it's no good.
There is a large number of programs about that will not run well
on any other TOS than 1.04 . My recommendations for switched TOS
are therefore as follows.

For pure gaming:

TOS 1.00, original unpatched version
plus
TOS 1.04, original unpatched version

For good gaming mixed with serious work:

TOS 1.04, original unpatched version
plus
TOS 2.06, preferably patched with WinX 2.3G and SHBUF
(both patches by Martin Osieka)

For best gaming _without_ installing any TOS switch:

TOS 1.04, original unpatched version

At present there are more good programs dependent on TOS 1.04 than there
are for TOS 1.00, and all that will run on both will do so faster and
safer on TOS 1.04 . Also (perhaps most important), there are so many

bugs in the GEMDOS filesystem of TOS 1.00 that they form a distinct threat to the survival of harddisk partitions. Those bugs were only partially fixed in TOS 1.02, and TOS 1.04 is the first of all TOS in which the internal caching system of GEMDOS really does work properly. (The same is true of the 'fastload' flag implementation.)

Did you actually activate the SCSI IDs of these devices in the Device Configuration window? Also check your cables and especially your termination. A lot of users have their SCSI chain not properly terminated.
Since lots of users are using MO and PD drives with HDDRIVER (including myself) you can be sure that this is not a general problem with the driver.

All SH or Megafile models except the Megafile 44 (this was a standard
SyQuest 44 MByte SCSI drive) are MFM/RLL based.

Just for gaming, a simple 1040STF or STE with a colour SC1224 monitor is best.

Nah, no need for TOS 2.06 for just games. Also 4Mb might screw up some of the older games that assumed you could only have 512 or 1024K.

I think that it was translated and released by System Solutions a while back
(ISTR reading a review in an early Atari Computing).

Well, a search on http://www.blue-planet.com/tech/ (where you will also find such things as spec sheets and jumper settings) shows that the ST157N is definitely a SCSI drive. The ST157A is the IDE version, and the ST157R is the RLL model (that would have been used on the older ACSI Megafile units).

So you can definitely use that drive on a SCSI host. Use the jumper sttings sheet from the blue-planet site to deactivate parity checking on the drive, as the Mega STE host adapter does not support it.

Nick

Hi

I've tried every configuration I can think of:(

This is how I first tried it, with and without termination!

Link II - EZ Drive - CD 1 - CD 2 - CD 3 - HD - MO

At the moment I'm using this set up:

Link II - HD - MO

I sold the PD drive because I couldn't get it to work:(

I've done everything I can think of, including the device config. I doesn't even recognise it in the ID check. Saying that, one of my CD Changers doesn't show up but Extendos has no problem with it!!!

The only think I am not able to test and that's a different adaptor, I've checked with 3 ICD Link II's. I've also tested it on different machines: 2 x STE's, 2 STFM's and 1 x Mega STE, and I get the same result!!!

What I don't understand is why under ICD's driver it's detected but under HD Driver it's not!!!! All I need the MO for is to transfer data from my Atari's to my pc's for plonking on CD!!!

Any help is very appreciated, I think I only have a handful of hair left;)

>

No need for TOS 2.0+ for games. I have also noticed some problems with 1.4 (Rainbow TOS) running some games. The best TOS for the STFM's would be 1.2, I've not come across many that don't like it.

OK you gain a few K of memory in TOS 1.4, but it does have it's fair share of protection timing problems; doesn't it Mr RNC!!!!!!

Also as Atari are quite cheapish, an STE would be a better choice. Games wise it doesn't matter that much about the TOS 1.6 and 1.62 unless you're going to be using some med rez games!

Having 2 ST's you can play some MIDI games; MIDI Maze, and Substation if you have 2 STE's;)

If you go for the STE, then get the disk based TOS 1.09. This solves 99% of compatibility problems for desktop loading games. One day I may get time to see I can get it to run with Auto folder programs and games that use a sector style format;)

I use STE's and very rarely do I have to use any of my FM's when I test software!

> can I upgrade?

The STE is a later version of the STF with some enhancements, mainly:
-hardware scrolling
-blitter chip
-FPU socket
-SIMM memory
-TOS 1.62
-Stereo DMA sound

-Extra joystick ports (hardly ever used).

If you only want to play games, then you don't care which TOS version you have. If you plan on doing anything serious, then forget about the STF altogether and get at least an STE that you can upgrade to 4Mb.

My STe is pretty damn good. Its got 4MEG and a ADspeed accelerator which is surprisingly compatible with games running at 16MHZ. Which means many games that run a bit slow on the ST like Battle Command actually run with a good frame rate. If you go for a Mega STe or TT you lose a lot of compatibility. If you go for an accelerated STFM you loose STe enhanced features meaning you can't run some of the better later games. So unless I hear a reason otherwise I think I have the best ST gaming machine available. Unless of course there's another ST accelerator that makes use of a 68000 lets say at 20 or 24MHZ that can be toggled speed wise on the fly and doesn't need a later operating system that would reduce compatibilty.

As for STe incompatible games as far as I know most of these are available now in STe compatible cracked form. Although I've yet to come across a Die Hard 2 Ste compatible version.

Hi! I'm helping with computers for a charity thrift shop. An Atari ST with 1224 monitor was donated, and seems to work great, but I need some more info. 1> The OS seems to be GEM/TOS. How compatible is this with all the normal PC DOS software out there? 2>There is a plug for an external hard drive. Is this Atari-only, or will a generic HD do? (Any cards necessary?) Also, can they be found, and how much would they cost?(Someone has asked.) 3> Is the 1224 monitor like VGA, SVGA, or what? Is it compatible only with Atari, or could it be converted (plug conversion) for use with a PC or MAC? 4> Can Windows 3.1 be run on the system, if someone really wanted it? It looks like GEM/TOS might be resident in a chip. Sorry if these seem elementary questions, but my experience has been strictly PC. I really like what I've seen of this system so far, but can't answer the questions I've been given, and have been having trouble finding information. Thanks for ANY help you can give!

Bette F.

[Attaching a hard drive to a 1040]
>My two questions are,
>
>1. Which would be better, IDE or SCSI. I've seen alot on both

SCSI is the preferred/standard method. You just have a host adaptor to convert the Atari's ACSI port to SCSI. To use IDE I think you need TOS 2.06, which will add to the cost, and IDE interfaces are much less common. The plus is that the IDE solutions tend to fit inside the casing, whereas SCSI usually involves an external drive.

>2. Which ever one is better, what device would be the best way to
>interface to the 1040 and other St's.

To be sure of being able to use most modern SCSI drives you would be best looking at something like the Link97 adaptor. Older adaptors tend to be limited by such things as parity settings (about which I know next to nothing).

>I did not get any disks with the system, if anybody know a FTP site with
>images of the original disks, that would be great..

The original disks contain almost nothing (unless the machine came bundled in a package with games or educational software). Some machines came with a buggy and crude BASIC interpreter, other than that it was just the control panel: later versions are better anyway. Look for Xcontrol in the FTP archives.

You'll find most of your basic info, including the address of the Atari FTP site list, in the quick FAQ: http://quickfaq.atari.org

Hmm, now you mention it, I was also forgetting the Mastersound/Replay range of sound samplers too.

OK, I admit it, there are *lots* of things which use the cartridge port :-)

I am posting this query for a friend. She has some old Atati ST Single Sided disks that she wants/needs to recover the data from (it is pure text so the logical format of the data is not an issue). I know that if they were Double Sided that they would (supposedly) be readable as normal Windows Disks (possibly first requiring that a zap be done to a field in the Directory). Does anyone know of a MS-DOS/Windows utility that would allow Single Sided Disks to be read (the SS format was not supported by MS-DOS so it will not be seen as a native disk unlike the DS disks).

Thank you.

SCSI is generakky know as a "better" standard, but it's more expensive. Also on an STF, a SCSI drive will be external. An IDE can be internal (a small 2.5" unit).

>2. Which ever one is better, what device would be the best way to
>interface to the 1040 and other St's.
>

SCSI: The Link II or Link 97
IDE: There's not much choice, but Mario Becroft's internal interface.

>I did not get any disks with the system, if anybody know a FTP site with
>images of the original disks, that would be great..
>

Tut tut tut, that's piracy...

I've just replaced the old Star printer on my wife's 1040 with a Deskjet 500C printer in monochrome mode. She uses a mono monitor. I've been able to find a Wordplus driver (without graphics) by Frederick Mora & Pat Coffey and a screen printer [hpmondmp.prg] that work fine. The Speedo GDOS driver also works fine for Easy-Draw and Timeworks Publisher. I havn't been able to find:

1. A DEGAS Elite .PRT driver
2. An MX80 emulator that will enable me to print graphics from Wordplus.
   I've tried epsjet.prg 1.0 by David L Bailey; it seems to work for screendumps but I can't gat any sensible results through Wordplus.

Do such things exist? Replies to me, please, and I will summarize.

Thanks,

Denis A Nicole

If you are lucky, an old PC might be able to read them, but the only other way is to get them read by a real Atari. Try finding someone in your area who has one and can copy them onto plain DOS disks.

Using WordPlus and Elite?

Time to update your software maybe. There are some excellent shareware/freeware packages better than thos old programs. All the more modern stuff used GDOS, so you should only need one driver.

Hi

I use a program called DC Format v3, to add the MS-DOS bits on any disk from my ST's. Windoze can't seem to format single sided, but can read one.

Actually using CD Format you can have use an extended format and the PC should still be able to read it; as long as you make it MS-DOS compatible;)

I can do it for you, taking for granted you are in the UK, and not Kathmandu;)

I was wondering...
What's the deal with the pins on the 68882?
Most of these seem to have the pins below the chip. OK, I can understand
that, it's easier to plug in, harder to destroy and looks niver as well.
But the FPU-socket in the Falcon seems to be made for chips with the pins
coming from the side. Why? Is this for 68881 compatibility?
Coz' it seems to be almost impossible to get a (second hand) 68882 FPU
that will fit into the bloody socket!

Hi

I'm after some more info;)

I know on ST's it's possible to have switch between two TOS's; e.g. 2.06
& 1.62.... Is it possible to do the same with the Mega STE's so that it
can be run under 1.63 etc...

If so where do I get the upgrade from?

If this is an ST program where can I get it. While not a Windoze utility it will probably solve her problem (she is now using a WinTel computer and does not know if her old ST is still usable). If it is still usable, just Zapping the Disks will save lots of time in trying to read them and then trying to port them to the WinTel by Email [or ZMODEM via a Null Modem Cable].

I'm in the NYC area and she is in Tennessee (both in the USA on the west side of the "little pond").

I might be wrong 'cos its been a long time but her goes - Your tos is
probably 1.00 and guess what? there was a problem with the serial port - I
spent many hours trying to get it to work - finally someone gave me a fix,
I'll look for it if I find I'll send.

Technically I don't see why not, other than it's 1.62, not 1.63, and that it might run on a mega STE.

Try plugging in some old roms from an STE and see what happens before designing a TOS switcher board.

I recently purchased a Riebl network card. Apparently there are quite a few at B & C Computer Visions in Ca. Phone, 530-295-9270. Email, myatari2@juno.com

I was told when I purchased the card that I would have to replace the battery. I'm no good at this kind of thing but it appears that the battery is soldered onto the board. Could this be? Can anyone give me directions for replacing the battery? What is the battery used for on this board anyways?

No docs came with the board. Are there some docs available someplace on the Net?

Thanks for any help.

At last - some Atari content in this thread.

You should try a web search for SpiritWare.

This section of script should have the format:

```
#
# Dial script
#
FIND login:
RESP <username>
FIND password:
RESP <password>
#
# ...etc
```

HOWEVER by the looks of the data dump you posted it doesn't look as tho' you needs ANYTHING in your dial script after find_timeout. Comment those lines out and make sure that you have PPP ticked in the dialer.

```
>***************DEFAULT.CFG: - (NOTE: this file is a modified version of
>that found on the Freeserve part Gordy's site)
```

A general note to use spaces to seperate variables and their values.

That�s correct.

> directions for replacing the battery? What is the battery used for on
> this board anyways?

I cannot help you with the technical stuff. I have to ask as well somebody with "soldering" experience to do it for me (there is a new battery waiting on the cd-rom drive ready for soldering in). After installing the card with correct jumper settings, it is important to initialise it, which means it is told its unique hardware address. The battery supplies the card with the power to keep this setting. A card with empty battery switches back to a default hardware address, which is not unique. While the STinG/MagiC combo doesn�t seem to be interested, Linux will complain during bootup, if the Riebl comes with default address and empty battery.

> No docs came with the board. Are there some docs available someplace
> on the Net?

Without help from outside you won�t be able to check the jumper settings and correct them if necessary. My Riebl came with the settings for Mega STEs. I found something about it by using Riebl card as search keywords in Altavista. Sometimes the infos are contradictory. Depending in whether you want to have BNC or AUI you have to change another jumper as well.

Regards,

Kerstin

RELEASE OF NEW SOFTWARE
Exposure is a new software to control light with a Atari ST.
The software is beeing released at NAS in G�teborg/Sweden.

CHEEP ALTERNATIVE OF CONTROLING LIGHT

Exposure
A new software is beeing released for the TOS-based Atari ST computer to control lightdimmers.
The name of the software is �Exposure� and is released in its final version v1.00 at NAS (Nordic Atari Show) in G�teborg/Sweden 11-13 june.

120 channels for $29.95
Exposure is delivered with 120 channels control as a standard. The number of channels can be patch to maxumum 520 channels.
Exposure uses the PMX protocol (Pulsar) throu RS232/9600bps.
At the low price it�s a good alternative for smaller and mediumlarge theatres to ordinary lighttables of a much higher price.

With an Atari ST with one megabyte of ram you may use up to 6000
submasters, with up to 6 at a time.

Showcontrol
It�s planned to be a release in august for a add-on component to use
MSC 1.00/MIDI Showcontrol protocol.
This means that one single Atari ST can control a mediumlarge show,
including fire, smoke, CD-players, intelligent light such as
color/gobo and motorised components.

My experience is different. Mostly all FPU's I see have side-
connections. In Neuss there were many FPU's and all Atari-compatible.

I was told: the battery feeds a chip that contains that
physical number of the card (that is on a lable glued somewhere to
the card. New battery: put number in again. How?
Do not know.

>
>No docs came with the board. Are there some docs available someplace

Michael Ruge from 'Chips&chips' has a bit but no jumper settings.
Those I have here.

No docs: ok but also no software.

I fear you have to go hunting for the Mintnet stuff. There are
drivers for this card on the CD MiNT98 (German) and something about
the not so big relevance of the internal number.

Hello!

I have an CT2 installed in my Falcon, but it doesn't work...:((

Have anyone experienced this:

1. "Dead" computer - no booting, no initialization cycle, etc.
2. blue-green-black strips on the screen

CT2 was installed by an professional in a electronic service so all
the solders are in right place.

Any ideas, similair experiences?

thanks

sasha

I'm very interested in this...can you tell me more...is there an English version?

Do you want help to do an English .RSC?.....I've done German transaltions before and I can't speak german, but I know a chunk about theatre lighting...

> 2. blue-green-black strips on the screen

Your machine have two modes, normal and turbo.
Your machine run�s in normal mode or you got a black display?
If you have a black display in normal mode -> wrong installation.

Stripes, in which color ever, are a sign for bad ram / ST-RAM
(Not only while fit a CT2)

Follow the manual step by step and recheck all wireing.
Most mistakes: cut wrong ACIA pin(s)
ACIA pins devintive not correct removed from mainboard.

CPU pin not bend.. (original CPU)

Falcon must in normal mode work as a normal simple falcon!
If not, someting is wrong. Need�s a better description.

I make some hardware "services" here, also fit some CT2, Nemesis
FX-Boards and the hole rest...

Too far, Too expensiv..

All what i know about the CT2 board you found in DOITF030, main language in archive is german!

Regards, Robert

> Do not know.

The Atari Disks coming with the card contain a program to initialise the card. This includes asking for the hardware address. This program doesn't run under MagiC. It's necessary to boot up Single-TOS for it.

> I fear you have to go hunting for the Mintnet stuff. There are
> drivers for this card on the CD MiNT98 (German) and something about
> the not so big relevance of the internal number.

There is a driver for STinG as well. It is still concidered to be beta, but it works perfectly for me. But you anyway need the initialisation program for the hardware address, the one from the STinG beta release didn't work neither under MagiC, nor under Single TOS.

Here comes a graphics:

```
     +-------------------------------------+
    +|  AAAAAA                             |-+
AUI ||          D                          | |
    +|                           C         | |
     |                           C         | | VME
BNC =|                           C         | |
     |                               BBB   |-+
     +-------------------------------------+
```

The A and D jumpers are for addressing AUI or BNC. They have to be put altogether either to the "top" or the "bottom" of the card. I can't recall the settings on my card, but one of the documents I've got says, they should be on top for AUI the other one says the contrary. Just try, all six jumpers have to be changed the same way.

For a TT all C jumpers have to be set, for a MegaSTe none (according to one of the two documents). As far as I remember, this is as well the setting for my Riebl.

B jumpers are not explained but are described as set/not set/set.

Regards,

Kerstin

I'm going to be running Linux. Maybe Linux doesn't need this hardware
address for the card, and hence I don't need a new battery?

Thanks for the graphic and the explanation Kerstin.

Hmm, Linux will complain during bootup, but you are right: There is a trick how to prevent the complaint. The card�s battery may be empty, but despite this the card can have a valid hardware address. Some lines are added to one of the init scripts. These lines handle over the hardware address to the Riebl during Linux bootup prior to the installation of the Riebl driver. In this case you don�t need a battery. :-)

> Thanks for the graphic and the explanation Kerstin.

I hope it works. It is a little bit nasty to put the card in and out again to find the correct settings.

Regards,

Kerstin

I bought one a while ago from System Solutions. I think for about �30
inc. p&p. I think they use a german supplier. I will drag out the
receipt. I never got it fitted. I think I bent one of the side contacts,
the amount of pressure needed to seat in the socket is frightening. When

I managed about 3/4 way down all I got was noise. At least I could get it out and didn't crack the socket. The only reason I got it was for Photoline. If I get another I will get SS or whoever to fit it, on a 'if it dont work, I dont want it' basis. I was going to bring my falcon to Stafford this month, but couldn't make it.

I need to know what signal is on each of the wires in the SM124 monitor cable. My monitor cable has been cut off, and I dont know what the wires are.

I have to solder the wires to a new plug. Can anyone give me details about which colour go to which pin in the plug?

I have here some disks with sofwtare but that setting program escaped
my attention. never got that ANS working.

My jumper settings are for the TT:
```

jumper array A J1-J6 all to bottom (for BNC)

Jumper D (J7)
to top (some say: none.) What is it?

jumper array C J17-J23
all closed for TT

jumper array B J-J10

jumpered as closed/open/closed. Is this OK?

Hi!

I'm using my ST's for music.
One of the reasons is that thei do not make any noise :-)

Recently I've got a Stacy, but could't figure out how to stop the
internal harddisk drive. How can I do this?

Thanks a lot for any advice!

Hello again everyone.

A lot of people have been very helpful and pointed out the mistakes in my files, but I still haven't got any further connection-wise. A few people have told me I need to send the $GET_IP command after FINDing the string that comes directly before the ISP sends me the IP number. The problem with this is that my ISP doesn't seem to want to send me an IP number (or at least it doesn't send it before it disconnects me). All I get is the message "Switching to PPP." and then a repeating string of nonsense characters that mean nothing to me and then my ISP disconnects me. I have been using Hyperterminal's terminal window (comes with Windows98) to watch what happens.

On another note, I was getting far too frustrated trying to make Sting work using PPP so I selected SLIP in the Sting Dialer instead... the result was that I actually got past the "initialising link" stage to "Link established" but I still couldn't get the IP number. Does anyone know what's going on?

Fraser

while its booting tap at control or alt,also there are "park programs" that can be set to stop and start it at will. if you want to stop it for good make sure you have some sort of hard disc driver software on disk and backed up,then boot as normal and remove the .sys file from the root of C the name of it will depend on what software has installed it in the first place,don't worry the Atari hard disc stuff is free

Is the Atari TT030 Y2K compliant? If not, is there any patches to fix it?

Are TT and ST programs generally Y2K compliant?

thanks.

Hi everyone!

I'm looking for an address where I can buy Atari power supplies. I found out that the two things I found that are not working, an SH205 and an STF, have got nearly the same power supply. They're both broken... So I wonder where to buy such thingies. Or how to make them. Are there some problems that occur often with these thingies? Of course I tried new fuses, but they flashed :-/

Greetz,
Kasper

btw: I thought I sent a msg before, but it didn't reach the newsgroup?!

Yes, all Atari hardware featuring an RTC chip is Y2K-compliant.

Older ST/STE machines (up to TOS 1.62) that don't have one fetch their time from elsewhere and need to be patched, however.

> Are TT and ST programs generally Y2K compliant?

Generally, yes. There are exceptions, of course.

We are trying to put two VME cards in aTT (tower installed of course),
one card is a graphic card; a Crazy Dots 2 and the second one is a
Rieble card ...
Until now we have only been able to get almost no signal from the
graphic card ... when putting back the CD2 on the genuine VME board, it
works, but when installing it on the double VME board, it almost gets no
signal ... I say "almost" because we can see a little flickering screen
on boot, but it's all.
The only changed thing is the cable lenght but the connections seem all
right, the double board comes from a german reseller.
Any help or experienced owner/installer will be appreciated.
Thanks

Jo

Andy:

There is a FREE atari concordance program from Spiritware.
lets see if I can find the addy: AHH..here it is:

http://www.halcyon.com/fabc/atarifiles.html

If you have trouble downloading, email them and they will be glad to help.

The concordance program includes the king James version, a Greek new testement and dictionary along with word searches, statistics on a word, and a text editor to copy and sort verses into. Also utilities to take any book and turn it into an text file.

Hope this helps!

Hi Derek and Steve!

Reading the current issue of Atari Computing, I noted that DA's Layout Pro can do EAN 8 and EAN 13 barcodes.

Apparently a new version v6.2 has been produced, and a demo can be downloaded from:

http://www.digital-arts-ag.ch

Cheers!

James

Hoping to get a Centurbo II soon.
The Falcon already has 40mhz FPU.
Will this chip work with Centurbo II?

No problem, a 40MHz FPU should run fine at atleast 64MHz, perhaps even 80MHz.

hmm, I had tried all sorts of key's while booting,
and following your suggestion I tried a series again, no luck...
Maybe it works only with a special HD driver, or is it in TOS?

> also there are "park programs"
> that can be set to stop and start it at will.

that's what I'm looking for. I didn't find one yet.
Could somebody please tell me a files name or a URL to look at?

Would this stop the disk physically, not just leave it invisible to the
operating system?

> don't worry the Atari hard disc stuff is free

you mean the stuff that's on the 'ATARI Hard Disk Utilities' disk

Thanks a lot for your suggestions!
other hints are still very welcome...

Yes. 33Mhz or higher FPU chip works perfectly.
16Mhz type doasn�t work.

Remove FPU from mainboard socket, put if on empty FPU socket on CT2
board. That�s all.

Regards, Robert

Once again, it seems that your script doesn't require anything entered in the section marked "dial.scr" in your dial.scr file. Ie there is no wait for/resp sequence required, just tick the PPP box in the dialer and let it and your ISP sort out the details of your conection automatically.

with a floppy in / out ? try both but as below the drive will still spin

I'm think something like this applys to all drivers   I've used most
,done a lot of expermenting and allways managed to stop bootup from hard
disk if I need ,there was someone on here a few months back who had an
auto conflict,recconed he couldn't stop boot up and dismantled the
machine!!!!,

A short period of time ATARI marketed some PC clones.
So I think it is what it suggests: A 80286 processor and 30 MB HD.
So it probably runs MS dos. Woooow!! ;-)

Henk.

I use TOS 2.06 in my tower STE, and it's in no way the same as 1.62. I find it doesn't cope with the high density drive as well as 2.06.

I've decided to run the tower 1.62/2.06 machine parallel to the Mega STE.

I am after a set of 2.06 chips, or even a part chop with the 2.05's I have here.

I noticed that you have upgraded you Mega STE! I presume that you know a little of these machines, as I can't find bugger all on the internal structure. I know one of the main mags, in the UK, cover bits and pieces for the MSTE's, I've not been able to find them yet;(

I do like to take the machines I use as my main ST's to their best potential.

All information will be more than appreciated, as this will save me time by allowing me to get on with the PD libraries (LaST PD) and my web site. I am working on it, I promise, I am;)))

Will anyone that responds to this please, pretty please, send me the your replies via email AS WELL as posting in the news group.

Hi Daniel

For a while Atari went with the flow, as did Commodore, and produced a couple of PC clones; an XT and an AT model, of which one was called an Atari PC III.

I presume that is may mean a 286, that took some working out I can tell you;), and possibly a 30 meg processor (unlikely) or a 30 hard drive (more likely).

They also produced the monitors that go with them. I know someone that

found one of these monitors in a second hand shop, and they don't fit
the ST's!

It's nothing more than a 286 PC clone. It will run DOS just like any PC.
Nothing to do with an Atari ST.

Nicholas

That would only bypass the drive on boot, but it wouldn't stop it spinning.

The only thing I could think of, is take the stacy apart and build a little
switch on the drive's power supply cord so you can switch it on and off
before booting. I wouldn't do it with the machine on though.

That's wrong. TOS 2.06 is much more advanced. It is much more hardware independant, for example, it will address up to 14Mb of RAM (with a Magnum board) or it can use IDE drives. Older versions cannot do this. It also supports HD floppy drives, 16Mhz proc speed, cache. And don't forget the MUCH better desktop with customizable icons, keyboard shortcuts, windows backgrounds, etc...

If someone uses AHDI 5.xx or better with MACCEL, there is a Stacy-
specific option that allows spinning down the drive after X minutes.

This uses some undocumented hardware control abilities, thus was
onyl available if using AHDI, afaik.

hi,
 I'm sure this questlion has been posted before, but I'm a newbie.
Is it possible here in America to get a 1040 st to run on a tv
as a monitor? Please tell me how.
james

If it's an STFM or an STE it will have an RF socket that will plug directly into your TV's antenna. If it doesn't have one of these, you will need to use the RGB output to connect it either to a TV with RGB inputs (like a SCART port), or to an RGB monitor.

Use a scart lead. (Contains composite video)
Best way, i�m not sure your 1040 contain an tv-modulator.
You got a better display while using scart.

Ask BEST-electronic for a ready to use scart lead.
Ask DOIT_ST for colorised schematics.

Regards, Robert

Hi all,
I have a problem on the Download module when I want to download
a file when I am on line,the one that downloads in the background
while you do something else,I right click and run down to the download
bar and nothing happens.
All the modules are in the folder,I have done a new re-install,also the
Hotlist check module is not working.
I can download with a left click on the mouse and when the file
selector comes up I can send it to the drive of my choosing,but it is
the download that runs in the background thats the problem,it simply
does not come up,

any ideas anyone,
thanks,
Rob.

Many questions... :

-Is there a possibility to plug the ST on a VGA monitor, with some modifications?
-Can I only get mono on a VGA? (I heard so...)
-I've also another question: I have a 48Mb HD in my MegaSTe, but it seems to be an ASCI (?) and not a SCSI. So there's no way to plug a SCSI HD on it? Can I change the controller for a SCSI or IDE type? (and where can I get this????)

That's all, folks!

I hope someone can help me...

No mods required, either build the adaptor on DOITF030 or buy one of Mario Becrofts VGA-ST adaptors...

>-Can I only get mono on a VGA? (I heard so...)

Mono only unless you have a really old slowe multi-sync and a switching unit or special cable for Lo/med rez...

The controller board converts ACSI to SCSI, you can fit a bigger drive easily, I've seen over a gigabyte on standard MegaSTe hosts without trouble....I have some 424Mb and a 1Gb for sale in the UK if you're interested, I also sell the VGA adapters..

Assuming you're using Dan's OVL, this is the problem. It's supposed to
work with Stik though...

I use Olivier's OVL instead and it works fine. Look at this link:

http://services.worldnet.net/vcf-com/sti_cli.htm

It was my first thought to do it this way, but a earlier try to open the
stacy case showed me, that this is not trivial (until you have found out
how to do that, of course ;)
ok, as I know me, I will try again anyway, sooner or later...

for the time being I try the soft way... ;-)

Both Thing and jinnee have "Eject media" menu items which will spin down a
selected hard drive. Any data access request will spin the drive up again.

Still has a problem. If you go to the scrolling window to pick a new colour,
the only time that you can see a colour to pick is whilst you're scrolling
the window. The slider gadgets in the preceding box don't have any borders
and there's no display showing what's happening as you adjust these.

ACSI/DMA was the interface on the older STs, for Megafile and SH drives.
The MegaSTE internal host adapters were SCSI. Check the type of drive
you have with http://www.blue-planet.com/tech/

Hi,

I'm sure I have a ACSI/DMA controller: that's what HDX and other programs
shows me.
I have a Mega STe with a Tos 2.05. and a Seagate 48Mb.
Can I find a normal SCSI controller for this machine? And then plug a bigger
HD on it?

I found this page during one of my web browsing sessions. It seems these guys have developed a parallel port cable and drivers to run IP over 1284 (parallel port), and the adapter works with PCs, Amigas and Ataris. The cable is called Smartnet98. Has anyone out there actually tried this thing? If you have one of these cables working, I would like to know how well it works...

Here is the link: http://rcswww.urz.tu-dresden.de/~sb227788/

Thanks,
Chris

HDX reports an ACSI/DMA controller, because that is where your SCSI host
adapter board is connected. I'm pretty sure you actually have a SCSI
board, because there is no such thing as an ACSI hard drive mechanism.
All the ACSI/DMA interface devices made for the Atari are actually
interfaces that connect to a SCSI or an old MFM/RLL hard drive.

The drive mechanism itself can only be SCSI or IDE (or if it's VERY old,
RLL or MFM, but probably not on a Mega STE). What is the exact reference
of that drive ? This should tell you what kind of drive you have, and
therefore what kind of drive you can upgrade to.

Yeah, but that's not the same as Ethernet, though.
It's more like a faster version of PLIP.
If you want to see a real Ethernet adapter which also
uses the parallel port, try this URL:

http://atari.scum.org/

OK, it's not as fast as the Smartnet cable, and it's not really working
yet, but at least it's true Ethernet :-)

So would Atari Computing. We covered this as a news item a while back but despite several emails and sending them a copy of Atari Computing in the post we haven't even had a reply, which is very dissappointing because it looks like an excellent product.

If anyone does get a reply out of them or they're lurking anywhere hereabouts we'd be delighted to hear from you!

No ISP supports Atari. We just manage to be compatible with what they
can provide.

As far as I
> can tell, I have Sting set up correctly, but it still just times out on

On my side, the timeout on initializing link came from 2 causes:
-Forgot to set the STING.CPX to Active, then Save
-Forgot to pay my ISP, so account was shut down ;-(

> What do you think... Should I give up? Is there some other setting I can
> fiddle with on the control panel? Maybe that slider called "delay" in

That shouldn't have any effect on being authentified by your ISP.

Mime-Version: 1.0
NNTP-Posting-Date: 28 Apr 1999 19:11:03 GMT
Newsgroups: comp.sys.atari.st.tech

Hi All,

Welcome to the final message from Floppyshop. As you all know, we closed our doors for the last time in mid-February. A lot has happened since then and that's really why this message has taken so long to compose.

When we announced our closure, we did not know what sort of reaction to expect from our customers. We were unsure as to whether we would be greeted by complete apathy, a trickle of nice letters or a total backlash of angry letters from those who considered us to be leaving the sinking ship. What we did get was none of the above and we were literally rendered speechless (those who know Steve will understand just how difficult it is to do that)!

From day one, we were inundated with orders. Naturally the knock-down prices were a major contributory factor, but there was more to it than that. Customers were buying up everything they had been intending to get round to purchasing one day, and they wanted to stock up while they could. This mad rush only really slowed down after our official closing date of 30th January 1999, something which certainly surprised us! It showed a high level of trust from our customers, many of whom had been with us for 10 years or more. Nobody was concerned about us disappearing without trace and failing to supply their goods, like so many others in the Atari market have done. Accordingly, trust like that has to be earned and all orders (even those which arrived after our extended closing date of 12th February) were honoured up to the time our PO Box closed down.

Equally important were the messages of support we received from customers during the course of the sale. They ranged from brief telephone calls to lengthy letters and emails, all of which were most welcome. The number of Atari users who took the time to thank us for the services we had provided for them over the years and wish us well in our future exploits, was phenomenal and indeed totally unexpected. From our point of view, we were only doing our job and we were not looking for gratitude, though such messages were well received and most appreciated. Please allow us to express our gratitude to you. Without an Atari Community in the first place, Floppyshop would never have existed. It was an important part of our lives and the memories will remain with us always.

Many customers expressed concern about what would happen to our products after we closed down. We too had our doubts and were delighted when several companies and individuals approached us with a view to taking over remaining stocks. We are pleased to announce our surplus stock of commercial products and the distribution rights to most of our CD-ROM compilations have been acquired by our good friend Paul Glover at FaST Club. Paul was probably the first to start up a PDL shortly after the release of the ST and has a longer pedigree than us! His expansion into commercial software and magazine publishing has made FaST Club a household name worldwide. We would like to thank Paul for ensuring these products remain available to Atari users.

Similarly, our Public Domain/Shareware Library has also been saved from extinction! In this case, our thanks go to Andrew Plumridge of Falcon's NeST PDL for his brave and salient rescue of this fine collection (well we would say that!). Andrew has pledged to update and expand the PDL with catalogue updates being sent to regular customers in the true Floppyshop tradition. These two staunch Atari supporters have been prepared to go out on a limb in order to ensure continuing support for the Atari Community. We trust you will repay them for their efforts with the same level of support you have always given us.

It was only natural that all rights to our Sounds & Stuff CD-ROM should revert to Electronic Cow as they were responsible for its compilation. A number of the other packages we sold in the last couple of years are still available through Atari Computing's readers offers.

The "Floppyshop Commemorative Site" is now on the Web. Funny how we had to close down to find time to finish the site! The main page leads to three distinctly separate sites. There's a potted history of Floppyshop in our "Ancient Burial Site" and and a quick roundup of the Atari Scene in our Contacts Site, finally there's the Virtual Christmas Party which is near identical to our Christmas 1998 site, suitably updated to take account of the changes which have taken place since then. "Our Virtual Christmas Party" site had over 1100 visits, we're looking forward to reaching our "second millenium" with this one!

All the information on our former releases can be found here as well as full contact information, not only for those whose who have taken over the distribution of our products, but also to everyone who's anyone in the Atari scene.

It's Been Fun, Of That There's No Denying. All that remains is to wish the Atari Community well for the future and thank everyone for their friendship and trust over many years. In the words of my late grandfather, Tom Delaney, Everything In Your Favour's Against You, but as an Atari user, you'll rise above such things and face the future with a courage and determination no PC owner could ever hope to match.

Thank you for everything, may you live long and prosper.

Goodbye from

Steve Delaney and Irene Lamb

Commemorative Site at http://www.floppyshop.cyberstrider.org

PS If you want to know what we're up to nowadays, our new company's site will be going live in a few weeks at http://www.mirrorimages.co.uk

Fraser,
Can't tell you to give up (I'm a die hard) so, it seems to me there should be something in your dial script to reply to your ISP's prompts (like username and password besides the PAP fields because it sounds like your ISP is waiting for 'something'!

Have you tried a terminal/on-line program like Flash ,or whatever, to see what your ISP is initially asking for? for me (case sensitive):
username: my username here
password: my password here
>   : ppp

It also seems there are variances between ISP's as to what should be in the dial script (hence the need to see for yourself with a terminal/on-line type program).

The SCSI adapter in your Mega STe should take bigger harddisks,
just make sure that your new drive can be jumpered to "parity off",
or build a parity generator circuit (one single 74HC280).

There is also a description for converting the adapter to take two
SCSI drives instead of only one.

Atari Corporation envisaged that nobody would need more than one HD,
just like some other company envisaged that nobody would need more
than 640KB RAM memory...

Are you running a multi-tasking system (ie. MagiC)? You need to in order to
utilize this feature.

I'm interested in making a quite long null modem cable to connect
a Mega 4 and a Falcon 030. The question is, how many leads do I
REALLY need to do this? What pins should be connected?

This cable will be rather long, and I'd like to make it go from the
Mega's MIDI port to the Falcon's LAN port.

Thanks,
Brian

I've a Mega 4 with a Megafile 60 Hard Disk.
Is it possible to connect a LINK 97 device to the thru port on
this system and use both together?
I.E. To connect a CDR device/scanners/etc.

Thanks,
Brian

Hi!

Remember the videokey???? I had one, then used it for experiments
and threw the rest away! :(

Question, the ST sync signals had to be combined for this product. Anyone got a schematic of the
videokey? And, that sync combining circuit?

Regards,

Jim W. Krych

<snip>

Yes, post it (minus password) and let us look it over. Also, one of the best things you can do for yourself is to dial your ISP using a comms program like CoNnect, Flash, FDT, etc,... Watch the login process as you do it manually, note what it expects and when. This information can then be used to write your script.

See ya later... ;-)

I'll describe this to the best I can:

I have an STE that has the standard 4 SIMM sockets. 2 of the slots are filled with the standard 520 configuration.

In the other 2 (other memory bank) is 2 SIMM like boards that lead to another circuit board that has 2 1 meg SIMM's solder directly to the board and 2 empty SIMM sockets!!!

This gives 2.5 meg of memory! What is it?

There is no clues on the board, and it is of a commercial quality.

If they do read it now, don't worry. We've got together by email and exchanged photocopies, so we should have complete mags by now.

If anyone else wants the missing pages, let me know and I'll sort them out.

Cheers!

James

My guess is the original owner bought a 4 meg upgrade board but could only afford 2 meg worth. I remember those days.

I bought a new-life board for a Macintosh 128K... was only able to afford two simms and the other two were later populated. Of course, the other two slots went flakey and the computer was downgraded to a 2 meg machine till it finally found silicon heaven.

The dead carcas of my Macintosh 128 is buried somewhere in my living room. :)

Alright, I figure this question should be asked once in my Atari career in computerdom....

Got parts lying around... mainly from my Macintosh days. I see the inside of an Atari and then a Mac... a lot of similar pieces. What are the chances of salvaging parts off the Macintosh, getting parts from elsewhere, and building an Atari computer?

(Bracing for the barage of XM301s that will be thrown at me...)

I am an Atarian from the 8-bit days. To me there is no greater device to use for storing and constantly using a program than ram/rom based. No mechanical components to go out, nothing to lubricate... to me, it's heaven.

The only modern day equivalents that come close to the bliss of a cartridge is a flash-ram card (that I tend to use on a Newton) and of course rewritable CD ROM's are nice. (While the drive has mechanical parts, at least the CD platter will survive...)

So I'm curious... the Atari ST has a cartridge port that can handle a 128K cartridge (been into the ST scene for only five months tops). So far I've heard of a terminal cartridge and the Spectrum (Macintosh emulator) cartridge.

What else on the ST was/is cartridge based?

Yes but can be an expensive way.

>
>   So I'm curious... the Atari ST has a cartridge port that can handle a
>128K cartridge (been into the ST scene for only five months tops). So

Unfortunately the boffins at Atari decided to leave the WRITE line out of the cartridge memory area. Most cartridges that need to send data use the read line to tell the cartridge to read etc.

>
>   What else on the ST was/is cartridge based?

>

There are all sorts of cartridges, one operating system springs to mind
but I can't remember what it is.

I do have a terminal cartridge (VT100) in my cartridge collection.

Hi

I'm trying to track down a spinning Fuji (the Atari symbol), can anyone help. Ideally it would have to be in GIF format for use on my web site.

Steve Stupple said...

I'm from the 8-bit school. I started with a ZX81 with a massive 1k memory, way back in 1981!

Pity, you could have had an Atari 400 with 16K for only $400 in 1979. :)

By 1982 I was buying that very 400 for $150 with a $50 rebate at Best Buy. It was at that point Atari was affordable enough to step into my home. ;)

Well, I'm currently trying to secure one of those VT100 cartridges for my BBS usage. Hope to get an answer back soon.

In the meantime.. hey.. does anyone here make cartridges? I would like to find out what cartridge based programs existed.. maybe pick up a few in the future. Since I like collecting Star Raider items.. a ST cartridge of Star Raiders would be cute. :)

And if we can make cartridges.. I would like to find a program that supports ansi that I could port to a cartridge. The first big trick is finding on under 128K. Freeze Dried term for example handles ANSI.. but unfortunately is 441K. :(

But then it has a lot of bells and whistles.

Hey.. let's talk.. it's good to talk!

Not much. I have heard of an Atari diagnostic cartridge and a kit for making your own cartridges. Otherwise it's been mostly used for dongles (eg Cubase, Notator), real time clocks (eg Forget-me-clock) and scanner connections (eg Golden image, AlfaData, Naksha).

Alright.. I hang my head and admit.. my 68030 Macintosh under MagicMac is becoming a better Atari computer than a Macintosh. This is crazy! I thought emulators were supposed to DETRACT from the processor speed.

Please write me at greg@atariusers.com

Would like to hear from other MagicMac users, hear the pros and cons about it.. I'm thinking of registering but just trying to gather some information first.

That is the main bulk of the message...

Doctor Clu
Enjoying MagicMac demo on the 68030 Macintosh.

Other thoughts for those reading onward...

- -Page Stream... runs blindingly fast (at least compared to the club 4 meg 520 ST fm). It's had trouble recognizing GIF files. Is this a page Stream setting I need to set, or a MagicMac compatibility problem?

- -Freeze Dried term.... freezes. :) Is there a special way you need to set up the modem port? This is VERY important since I am planning on experiementing with CAB.

- Here's a fun question... is there any way to have Magic Mac setup so you don't need the Macintosh System at all.. but can run it STRAIGHT OFF MagicMac? (grin)

EPROM Programmers, backpack (all the code is in cartridge and the acc
accesses it), Robokit (robotic type interface), Fast BASIC, stereo
output devices, ripper (inc. multiface ST), cartridge prototyping
interface (allows experimenting like a breadboard) there is more but
can't think at the moment.

There's more than you think.

I just went to turn on my TT and find that my TTM 195 19 inch monitor will not come on. I've had the monitor almost three years now with no problems whatsoever. The power led does not light up, so I'm assuming the power supply has problems. I'm sure I remember reading about failing power supplies in this monitor, and I'm wondering if any experienced Atarians can point me in the direction of what might be wrong. I already checked the fuse and don't see any obvious signs of overheating or burnt out components.

I've tried to reach Martin Eric Racine's TT030 websight, but I get the wonderful "waiting to connect" message and CAB locks up everytime. (Hasn't anyone come up with a solution for that yet? CAB is just torture to use because of it.)

If anyone can offer helpful advice I'd appreciate it. 640 x 480 is remarkably confining after using the big monitor. I'm not afraid to do some home servicing, but it would be nice to know if there is a likely component that has failed and where any capacitors might be retaining a jolt for the unfamiliar repairman.

I have an SH204 Atari shoebox hard disk and I am using the cards inside to put together something in another case. The power supply is non-functional, and I am going to use and old PC power supply.

So I bought a Seagate 251 drive, which is MFM, but it has an edge card connection on the back. Now someone told me I need a SCSI drive instead. So what are the real facts? Does the drive have to be MFM is it is SCSI?

(I had been using a Seagate 251-N drive in the SH204.)

Hi everybody,

I've been in the 8bit scene now for a while and have a full collection of every Atari 8bit item made. Now, I'm starting to get into the 16bit arena now and just bought a 1040STf with a 1224 color monitor for $25. Everything works, it boots up but I want to hook up a Hard Drive to it.

My two questions are,

1. Which would be better, IDE or SCSI. I've seen alot on both

2. Which ever one is better, what device would be the best way to interface to the 1040 and other St's.

I did not get any disks with the system, if anybody know a FTP site with images of the original disks, that would be great..

Thanks everybody,
Jason(Mr.3DFX)

TECHnically speaking.. (pun for this newsgroup).. it is written:

"No one knows about that day or hour, not even the angels in heaven, nor the Son, but only the Father." Matthew 24:36 (NIV)

My interp:

Signs are only roadmarks. And prophecies show with hindsight that prophets actually knew what they were talking about.
The idea to make sure you're on the right path/road..always! To put it bluntly, if you are waiting for signs and wonders to show you that last moment... you're wasting your time.

Y2K... too convenient. Too even of a number I think.

If you want some real fun predictions... how about the Mayan calendar that ends around the year 2028. This would not be so interesting if this was not the same time that the Earth is supposed to come fairly close to a large asteriod.

And isn't it ironic that the feet of the Statue in Daniel, symbolizing all the civilizations of mankind with the head as the earliest to the feet being the last.. is smashed at the feet by a large rock?

Fun to ponder. ;)

In the meantime... live life as you best can, and enjoy to the fullest; we are not even promised tomorrow.

Doctor Clu

Hmm... I can connect to megacom from any place in this town....

Anyways, the repair involves replacing two high-power transistors
and re-heating all solders around that huge choke in the middle
of the circuit board. The repair is described in CHIPS555.HYP
by Michael Ruge: http://members.aol.com/michruge/download.htm
(at least, there is a part list, AFAIR).

What's it about? Just a PRG running from the cartridge or som extra
hardware?

So there is still people using the old FDT?
If your computer is an STE then you have room for an additional 512KB of
data
just above the TOS address range. If you have an ordinary ST you can
decode it
to accept a couple of MB:s of data on EPROMs.

Actually I was planning for some kind of a built in terminal progam to
let the
diskless and HD-less old 520STM act as a TTY terminal for Unix and some
debuggung tasks in DOS. It would be fairly portable since one could use
any
TV for screen.

The SH204 drives are MFM.

These are quite slow compared to SCSI drives, and restricted in
capacity.

Hello, can anyone help with the wiring for a Falcon to VGA adaptor. I found a reference in Nicholas Bales' QuickFAQ but it was a little confusing. It seemed to be for wiring a multisync monitor to use VGA modes. 'Multisync' read 'VGA' ? Any clarification, Nicholas? Anyone else? much appreciated.

Actually it will work on a VGA, but you have to leave out the switch to select the RGB mode and hardwire the corresponding pin to VGA mode only. You could also just build that same adapter, but it will only work with the switch in one position.

Nick

Here is the resume of a guy who is proficient in Atari VME Bus skills, I wouldn't pester him with questions, but I know people are looking to do some VME ethernet cards and video cards and such, so this person may be able to be hired to do the necessary work or be hired as a consultant to offer assistance in these projects:

I'm interested in any concordance/Bible programs for the Atari ST line. Or any Christian software period. Can anybody inform me on what's out there?

Thanks,
Andy Blakely

A work colleague bought my Atari setup for her daughter but she has no interest in it now. The monitors are a Phillips Colour and a mono monitor from The upgrade Shop. The printer is a HP 510 Deskjet. Every thing is in working order and there's a lot of software and games many boxed. I used it with Demon Internet for about 12 months with little trouble. If anyone is interested please email me with sensible offers.
Thanks for reading.

That means there is a too big load on the power. When fuse is ok he switches off in time.
But why? That is the big question.

The big controoler cards gives two connections to MFM.
But there is also from the small controller card a 50-wire flatcable
to the big one.
That flatcable is SCSI.

Nope. No PC will ever read that floppy. Send that disk to a nearby ST user so that he can copy the files over to a standard DOS floppy.

Nope there isn't one, except Cubase on the PC.

How did the ST die ? It could be the PSU (you change it easily with one from an old ST or a megafile drive) or you could try taking the machine apart and pressing down all the socketed chips which might have come loose.

I've been talking to this guy too, but decided it was a bad plan when he admitted that there was no dongle, manuals, box or anything else to verify that he was selling legal software.

Guess $40 for Cubase 3.01 was too good to be true.......

I will tade for a Atari Falcon Computer

Here is what you get The Supervision Handheld System in the box like new. Boxed TV Link its in Pal (dont know if it works on America TVs) and 27 games This is very RARE to find especially with all the games I have plus some are still sealed WOW. A must for Collectors. Only serious offer pleaseThanks

For those who dont know what the Supervision is , its a handheld game thats similar to the GameBoy The screen is bigger and the carts look about the same its a lot cooler looking to it also bends in the middle so you can angle the screen and it has legs that flip out so you can set it on the table and play it. It was released in 1992 and disappeared fast Its very RARE and hard to Find.

The games are:
2-in -1 Game (box)
Ssnake (box)
Chimera (box)
Pyramid (box)
Honey Bee (box)
Bubble World (box)
Pacific Battle (box)
Kitchen War (box)
Hero Hawk (box)
Treasure (box)
Grad Prix (Box)

Kabi Island (sealed)
Changeller Tank (sealed)
Egale Plan (sealed)
Dream World (sealed)
Ballon Fight (sealed)
P52 Sea Battle (sealed)
Popo Team (sealed)
Matta Blatta (sealed)
Penguin Hideout (loose)
Olymic Trail (loose)
Jaguar Bomber (Loose)
Alien (loose)
Police Bust (loose)
Scaffolder (loose)
Super Kong (loose)

E-mail offers to
katom96@aol.com

Thanks Tom

6.061, ask any archie for an appropriate ftp site.

Oh, and BTW it is a waste of time to get AHDI. I'd advise you to cantact Uwe Seimet and get a recent version of his HDDRIVER. That software will be compatible with new hd and exchangeable media drives

(PD, MO, JAZ, ZIP, etc., AFAIK even DVD-RAM).

Thorsten

>please help!

Try our Falcon8.prg for CENTurbo II because i found the same
bug and change the falcon8. The goal of this software is to
convert the internal format of Calamus to the video format.
It works only with 256 colours like Falcon (or TT) and it
will be easy to make the same program for ntc or tc mode.

Don't forget to check the flags of your Falcon8.prg: i found
it without any flags !!!

To a tower case ?

it's a lot of work, but at the end, a interresting result. You need to be a
friend
of screewdriver and iron soldier ;-)...if you understand me.
I did it and it's not very easy, but...Absolutly not impossible !
else you can try to put your ST into a 19'' Rack...I will try with my Falcon.

Laurent

I have the following for items for sale. The only rule is that the Jag, Jag
CD, and power pads must go together.
Here then, for your viewing pleasure is my list of Jag stuff. :)

Atari Jaguar with CD and 1 Power Pad, manuals, and boxes.

Cartridge Games:
Alien vs. Predator   Cybermorph   Fight for Life

Iron Soldier Kasumi Ninja Raiden
Rayman Theme Park Zool2
Trevor McFur in the Crescent Galaxy
Val d�Isere Skiing & Snowboarding

CD Games:
Blue Lightning Myst Vid Grid
BTW, I am not leaving the Atari scene.

Just got a catalogue from MABN Schiedam;
They have one for Hfl 99. Doesnt say 68881 or 68882 though.

Henk.

I would also recommend HDDriver, but otherwise, you can find an updated version of AHDI on www.soundpool.de .

Hello

The zip files of the Flash.bin are correct now! The problem
comes from st-zip 2.6: you cannot add caracters on a file in the
zip. After it, you cannot use st-zip to deflate ...

The beta version is for 128 MB EDO Ram and a better access to the
cardridge port (for Logic 2.5 and logic audio).

Does anyone knows what is the latest information on connecting
a PC Keyboard to the atari st (falcon) computer and where i can find
such
info?

Depends mostly on the MHz and the shop. Sometimes a 16 MHz is second
hand fl25,-

new ones (50 MHz) can be as much as fl 185,- or more.

Met vriendelijke groet,

can you ram an fpu in any ST and expect better performance? A bargain if
you can surely?

I paid about 30 pounds sterling for mine, then promptly broke the socket
on the motherboard so it's now useless!

You must ask this to Mario Becroft he has build an interface to allow
that, but anyone rember his email adress or web site ?

Not in an ST. The STE has an empty socket for a 68881/68882, I beleive, and so does the Falcon. The TT has an FPU as standard.

It will only be used by programs specifically compiled to take advantage of the FPU. These programs usually come as 2 executables, one that doesn't use the FPU and the that doesn't.

Can anyone help me.
I droped on an extrnal floppy a few week ago just to find when I
tried it it didn`t work. When I opened up the case I found that the
connector had been cut off, so I`am after the pin-out of the rear
of the floppy so I can rewire a new connector.
Does anyone know or know someome or somewher were I can get the
info I need.

Thanks
Karl.

No, only if you have software for..
(NeoN Grafix as example) (Neon needs an TT or an F030)

Surf to http://www.whalley.demon.co.uk/atari/texts/

There's some helpful stuff there for setting up HSModem and STinG.

I am after a manual and details fro the Mega STE computer. I need to
know what is what inside; where the internal SCSI fits and the pinouts,
and what fills an empty socket.

I would also like info on the 'LAN' socket.

ANY help & info for this machine will be VERY appreciated.

Thanx

From what I've seen of Atari manuals, it wouldn't tell you much of this I guess. The manuals cover how to use the desktop and that's about it.

>I would also like info on the 'LAN' socket.
>

The "LAN" socket is an appletalk compatible serial port. You can use it to connect a Mac modem cable.

There is not much to do. Simply follow manual and set what is needed
in the auti-folder. Defaults are OK.

read Sting manual.
make sure you have the CPX-es for STing.
Do not forget to set then right (Activate, protocol etc.)

With a special card you can, but....
the chip is plugged in as a I/O device and not as a co-processor.
And then you hope your sofwatre is so intelligent to see the chip

and the software needs to do a lot of FP-actions.
Then you can see some more velocity.

Mostly now people seem to put co-pro's in Falcons to make them POvRay
compatible or Linux-compatible.

Hi All,

Good news :-)

Due to a change of plan I will now be attending the Atari Show :-)

I will be wearing a badge, please come and chat with me :-)

You will find me on Chris Crosskey's stand or wandering around :-)

I look forward to chatting to you all :-)

I have such a card (Weide Elektronik) in my 1040ST.
A 68881 runs at 16 MHz. Basic arithmatic is about 10 times faster than
software routines, but only if you write directly to
the IO registers in assembler. The trigonometry and logarithmics
however are about a 100 times faster. The IO interface is very
cumbersome and takes a lot out of the performance, hence the difference
between these figures.

But I already have a TT030 since 1991, I keep this 1040St alive only
to be able to keep my programs compatable, and for old times sake.

I have a userfriendly set of assembler macros.
If anybody is interested, mail me. But it has been long ago I used
them, so I have to dig them up.
I can also put them on my homepage.

Henk.

hi nicholas ... multi-timbral boxes typically respond to all sixteen midi
channels, sysex notwithstanding midi does not support addressing separate
instruments on the same midi channel . This is why they need isolating to
their own midi out. Notes played on channel 1 of one box will also play on
the other if daisy chained with 'thru' socket. The workaround is to midi
mute unwanted channels. This is workable but fiddly, particularly on older
or less sophisticated boxes that don't remember settings. A multiple out is
more convenient ... or at least I'm pretty sure this is the score, let me
know if I'm wrong!

Cheers,.
jim

Hello,

I have a complete Atari Falcon 030 system for sale for 350gbp ono.

This does not include shipping - I would prefer a buyer to
collect so that they can assure themselves that everything
is working before taking it away - I live in Newcastle upon Tyne.

See below for a complete description. Any questions, feel free to
email me.

Michael
--
To send me an email substitute @ for % in this address:
michael.clemmetsen%syntegra.bt.co.uk

------------------ cut here ------------------
** Falcon System **
4MB RAM, no internal IDE
External 520MB SCSI drive and Falcon SCSI to 50w SCSI connector.
Loaded and configured with the software listed below as well as
loads of freeware, shareware and demos mainly downloaded from the
internet.
        (Seagate mechanism - ST3655N, including technical
        documentation.

The drive is internally terminated so you do not need a terminator, but will have to put it at the end of the SCSI chain if you use any other devices.)
ClockPatch fitted (by System Solutions)
(Required for accurate Direct to Disk recording)
TT Keys fitted
(High quality replacement keyboard contact cups that improve the keyboard feel -you'll definitely notice the difference if you are a touch typist)
Falcon VDU port to VGA adapter cable
(required to connect to a SVGA or VGA monitor)
BlowUp Hard II
(Hardware attachment that plugs into the cartridge port providing a faster horizontal sync, thereby allowing higher resolutions on suitable monitors, i.e. those that can take a variable horizontal synch signal up to 50KHz. Includes software drivers and manual. The software can be used without the hardware if the monitor is unsuitable, i.e. lower refresh rates have to be used.)
2 Mice
(Not Atari, i.e. better microswitched devices)

Tabby graphics tablet
(Approximately A5 size, including software drivers and manual)

SVGA Monitor
(Includes Polarising screen filter. Works well with the BlowUp software, providing resolutions around 800x520, depending on colour depth.)

Epson LQ100 24pin dot-matrix printer including Manual

** Commercial Software **
All are english language versions and are complete with original disks and manuals.
* System
HD Driver 6
(Hard disk driver including format and setup)
NVDI 4.02
(Display accelerator and TrueType and Speedo Font display and printing.
Including over 40 high quality Truetype fonts.)
Magic 5.13
(Pre-emptive multi-tasking operating system, including support for Windows compatible long file names)
Kobold 2.5
(Fast file copier and file management tool)
Geneva 006
(Co-operative multi-tasking operating system)
NeoDesk 4 005
(Replacement Desktop integrates seamlessly with Geneva but also works with Magic)

NeoDesk CLI 2
(Command line interface that integrates with NeoDesk)

* Productivity
Papyrus 5.15
(The best word processor/pagelayout application on the Atari platform. Includes features, such as discontinuous selection not available in MS Word. Can import and export to MS Word)
Calamus S
(Premier DTP app.)
Twist 2
(Relational Database)
Apex Media
(Falcon only graphics and animation app.)

* Programming
Lattice C 5.52
(Professional C compiler that can target all 680x0 processors. Comes with libraries and documentation for creating fully compliant GEM programs.)
HiSoft C
(C interpreter. May not work on the Falcon, but useful for its GEM library which could be used with Lattice)

* Games
The Killing Cloud
(3D point of view strategy/flight sim/shootemup in 21st Century Los Angeles.
May work on the Falcon using one of the ST compatability programs e.g. Backwards)
Epic
(3D point of view strategy/flight sim/shootemup in space and on distant planets.
May work on the Falcon using one of the ST compatability programs e.g. Backwards)
Frontier - Elite II
(This works fine on the Falcon and can run from the hard disk)

** Books & Manuals & Magazines **
Falcon System Manual
CalApp User Guide
(Calendar and Appointment Software supplied with Falcon)

The Atari Compendium by Scott Sanders (2 volumes)
Modern Atari System Software (HiSoft)
(Both these books are essential for any serious Atari software development as they document all the system calls and style guidelines for all released versions of the TOS operating system.
As far as I know none of them are published anymore

Atari World - issues 1 to 11 inclusive

** Other **
Box of floppy disks with a variety of public domain, freeware
and shareware software, e.g. MiNT and a bunch of MiNT related
tools and utilities.

A few cables that may be of use.

I have the following for sale. I prefer to sell the whole lot as a package.
However, I am willing to sell individual items but the ST must sell as a unit
and not as parts.
Here then for your viewing pleasure is a list of my ST stuff :) :
HARDWARE:
4mb 520ST with SC1224 color Monitor, SF314 Floppy Drive, mouse, joystick, l,
manual, System & language disks, and mouse cleaning ball.

GAMES:
GBA Championship Basketball The Sentry
MetroCross   Star Glider
Star Ray   Shadow of theBeast II
Guild of Thieves   Golden Path
AD&D Hillsfar   Gold Runner II
Station Fall   Grid Iron
The Black Cauldron Flight Simulator II
Battleship
Pirates of the Barbary Coast

APPLICATIONS:
Habba Check Minder   H&D Base   Hippo Pixel
Hippo Fonts   Cyber Sculpt   Art & Film Director
Multi Desk   Calamus Outline Art   OutBurst 3.3
VIP Professional   Flash   That's Write
v.3.1G
Atari Logo

BOOKS/PUBLICATIONS:
ST Basic Source Book

A Source Book for Atari Logo

BTW, I am not leaving the Atari scene.

> "normal" MIDI transmitter, as shown in a number of books (such as Robert
> Penfold's MIDI projects books).

bad news as the circuit isn't trivial, Xav also told me he has never found a schematic anyhow. A DIY for the experienced and knowledgeable only.

however, keep searching!

Hi,

New to the ST scene. I picked up an Atari 520 ST and an Atari 520STfm.

The 520 ST does not have any cables and the only has a monitor out (multipin).
Without a monitor, when it boots, the attached external floppy drives turn on like they are looking for a boot disk. Is that correct ? (no built-in floppy).

Picked up the 520STfm hoping to use it with the above setup. Hook up the

TV out to a switchbox to a VCR to Video and Audio outs. All I see is a blank white screen. Nothing else. Built-in floppy does nothing. Power light on.

Anyone have ideas of the 520STfm's problem ? Is there a tech FAQ that I can read to troubleshoot ?

Any help is appreciated,
Thanks.
-Mike

Hast Du einen 08/15-Midi-Adapter von Karstadt oder einem anderen Kaufhaus
gekauft? Daran *k�nnte* es liegen, da bei mir ein solcher Midi-Adapter
ebenfalls nicht funktioniert: Weder bei meiner jetzigen Diamond Sonic
Impact S90 sonst bei der Soundkarte davor - Soundblaster AWE 16.

HEEELLLPPPP
niether my Falcon or my ste will print legal in 3 programs.
imagecopy4, pagestream, calamussl.
all 3 quit printing from 10.5 on down and i tried my falcon on a laserjet
and it did the same thing which tells me it isnt the printer.
does anyone know whats wrong.
ive set my page dimenstions
then i set my printer paper size in all 3 programs.
then each one fails
HeLLLLPPP!!!!!

Yes, it always checks for a bootable disk, even though it doesn't need one.

This is typical of a machine with no disk in the drive. The drive might be shot. Try leaving it on for a few minutes, the desktop should come up on it's own. If not, then it could be some other hardware problem.

>Anyone have ideas of the 520STfm's problem ? Is there a tech FAQ that I

The Quick FAQ might help you for the basic troubleshooting, but there is no quick fix guide if it is really broken.

Nicholas

Hello Nicholas,

Merci beacoup. The 520 ST I was not able to check out as I do not have
a ST monitor but it sounds to me it is fine (looking for disk). The 520STfm
checked out fine. Let it sit for a while and it was ok.

Thanks,
-Mike

quite a lot of things it is a full multitasking replacement operating system,at startup the machine double boots,the code is highly optimized and most things run faster than tos,Magic has many fans and I would not

be without it,in fact I can say if it wasn't for Magic I would have abandoned my Ataris years ago

MagiC does replace TOS/GEM when booted. It is very similar to use compared to TOS, but it also allows multi-tasking.

When you install it not too much will appear to change but you will be able to multitask. The interface is similar to GEM so programs look the same. It took me some time to get MagiC working nicely on my Falcon, but now that I have I don't run TOS hardly at all. If I need to use TOS all I do

```
is reboot the computer and use an autofolder program that
allows me to choose TOS or MagiC (or otherwise).

Hope this helps...

Regards,

Chris Wilkinson,
/|\ ATARI Falcon030 owner.

The 13 pin socket is for a mono monitor, typically a SM124/SM125 but you can
connect any S/VGA monitor to this socket using a suitable adapter.
Mario Becroft has recently released his adapters and I have a bunch of them
here to sell at the Neuss show - they work fine and are inexpensive.

It's a complete replacement operating system so the TOS on ROM will
only be used to load it.

You will get multi-tasking, a new Magxdesk desktop and around 30%
increase in perceived speed. It's certainly worth having (and NVDI if
you can afford it!).

Can someone in the know help me with some scanner questions...

A while back I purchased a used Falcon setup and aquired the
GT Look software however I can't seem to locate an Espson
Action series scanner. This is an older Epson line I assume?

Anyway will this GT Look software work with newer Epson scanners or
should I toss it out and get some other brand? I would prefer to use
the sotware I already have if at all possible.

I want to run this on my TT if that helps to advice me. I don't fully
understand why each maker needs special software and so I don't want
to buy a newer Espon scanner and then have to return it if it don't
work.

Thanks much in advance.

Check with Homa Systems House in Canada
to see what scanners operate with the version
of the software you have. (Or upgrade and get
a manual in the process).

I have GT-Look v2.04 and an Epson GT-5500 scanner. This is not the
very latest model but then again I presume it's more recent than the
"Action" series. I would imagine that any Epson GT scanner will work
with GT-Look! Is there anything in the manual?

I have the following for items for sale. The only rule is that the Jag, Jag
CD, and power pads must go together.
Here then, for your viewing pleasure is my list of Jag stuff. :)

Atari Jaguar with CD and 2 Power Pads, manuals, and boxes.

```
Cartridge Games:
Alien vs. Predator     Cybermorph        Fight for Life
Iron Soldier      Kasumi Ninja              Raiden
Rayman            Theme Park        Zool2
Trevor McFur in the Crescent Galaxy
Val d�Isere  Skiing & Snowboarding

CD Games:
Blue Lightning         Myst          Vid Grid
```

BTW, I am not leaving the Atari scene.

Falcon030, 14mb ram, 540mb hd, 17" svga monitor, MagiC, Pagestream, NVDI,
ExtedDos Pro, ICD HD utilities.

I have a GT-4000 scanner with the GT-Look software. However I cannot get the scanner to work. I don't have a manual for either the scanner or the software. I've also got a cable that goes into the Atari's serial and midi ports (a y-split cable).

Does anyone know whether I can get Epson to repair it, and if so, have you got any contact nos? I've tried their website but it was of no help.

Cheers!

James

We am regretfully selling off our Atari ST software. 8^{(

Here is what the first batch my family has to offer, all prices do NOT include the cost of mailing these items, which the buyer will be asked to pay.

Microprose: Silent Service - $10
SSI: Stellar Crusade $15
SSI: Hillsfar $10
SSI: Star Command $10
SSI: Colonial Conquest $10
SSI: Warship $10
SSI: Phantasie $12
SSI: Phantasie II $12
SSI: Phantasie III $12
all three Phantasie games $25 - they really should be a set. 8^)
Ultima III $12
Great Battles (Austerlitz, Waterloo, Gettysburg and Shiloh) $15
Their Finest Hour, the Battle of Britain $15
Fire Brigade (WW2 East Front) $5
Gridiron (1 or 2 player) $12
Marble Madness $5
Financial Cookbook $5
Sierra: Camelot, The Search for the Grail $10
Epyx: Sub Battle Simulator $10

Please contact us at Wilson_family@juno.com (checked daily) or here at glennwilson@my-dejanews.com (most weekdays).

Gracias.

Hi

I'm trying to locate an Atari disk mag: The Ledger Disk Magazine 10 by the Untouchables.

The copy I have has been placed on a high density disk, bad move, and has gone bad (they usually do eventually when written using a standard 720k drive).

In return I am offering 2 disks out of the FORMER LAPD disk catalogue.

Hi,

Did you already try Willaert Computers in Roeselaere? Guess that's one
of the last persons who can and will repair atari's in Belgium.
His phone number is 051/22.14.28

Greets,

The GT-Look software seems to scan the scsi port whne searching for
the scanner, I think that might be your problem.

Yes the manual mentions some GT-xxxx models none of which I can find
and the guy that previously had this software pacakge told me he had
an "Epson Action II". So I was seeking the same model just to be
safe. I think what Epson has done is just renamed the product line
"Expression" but I was not 100% sure.

Yep, he is a very skilled man but alas since he has made the move to Mac
he has hardly the time to do anything besides answering phonecalls of Mac
user who where in trouble with their beast.
It's not very lickely he will repair your broken machine but give it a try
you never know.

Hello,

A friend of me has a megafile 44 with a atari bus -> scsi converter in?
Is it possible to connect other scsi devices to the megafile 44. If so,
how can I do this and how many devices can he put on the megafile (I
guess 6 other devices = 8 - megafile - scsi-controller).
I opened the box of the megafile once, and from whet I could see there
was no scsi-out on the device.
Will he need an external host adaptor like the link97? How much extra
devices can be used then?
Any suggestions?

You will not be able to use/connect more than 2 SCSI devices inside the
Megafile 44.
I have tried to put more but the inner scsi interface doesn't allow that :(.

> I opened the box of the megafile once, and from whet I could see there
> was no scsi-out on the device.

There are two SCSI connectors inside the Megafile 44, one is already used to connect the Syquest 44 mechanism and the other is free, it's just aside the first one. Also you normally have a spare power supply connector coming from the power supply unit.

> Will he need an external host adaptor like the link97?

If you want to drive the Megafile directly from SCSI you will have to build yourself a SCSI in/out on the back panel .... while you were looking inside the box you surely have seen there IS definitely ROOM to build one and Atari had planed to put one because if you look closer there is room on the main board to receive a SCSI connector and the board is printed to achieve that BUT there are bo holes in the board.

In my Megafile 44 I build a SCSI in/out connector but this only allowed me to drive one of the mounted hard disks which was not linked to the Megafile board .... thought the power supply will support two devices.
But of course you can connect both hard disks to the mother board and drive them thru the ASCI input .... be carefull with the ID assignements ... a pity is the ID dip switch is located inside the box with no external control: I made a little modification to this: desolder the dip switch and resold it on the BACK SIDE of the mother board, then cut a little window in the plastic box, so you will have good access when ID change is needed.

Jo

If your still having trouble getting a copy then your best bet maybe
the DHS message board..all the demo scene people are on there and not
so many use usenet.. they would be your best source.. try
http://www.dhs.atari.org

>In return I am offering 2 disks out of the FORMER LAPD disk catalogue.

Still wading through it all then? :)

Gut the host board out of the MF44, put it in a PC case, get an internal SCSI cable from any PC shop or a SCSI-Burster from ASP and add as many drives (up to limit of SCSI) as you like, SCSI-Burster will give you external SCSI connector too.....Mind how you terminate...

Hi Folks, I became the proud if bemused owner of a BM<S-100 system a couple of days ago...there's a BMS ACSI-SCSI adapter, an Adaptec SCSI-RLL (or MFM?) adapter and a 20Mb 5 1/4 foprmat Seagate HD......It doesn't have a lead from the BMS for an Atari, does anyone know the pinout, I have the lead from an old micros-SCSI to hand, and can adapt that to suit no doubt....

I need to sell my Atari Falcon which i got a few months ago becuase i need the money to buy a new car.

Hardware includes...
14mb RAM (Which cost me �100 to upgrade to).
256Mb IDE hard drive.
FPU math co-processor installed.
Microphone IN port adapted to work with Standard Line-IN levels, for HI-FI sound recording.
Monitor adaptor to plug in a TV with a RGB-Scart socket or VGA monitor.
33600Bps Modem, complete set of Internet software, and a account with Freeserve.
2 Mice.
2 Game Pads.
1 Jag Pad.
1 Joystick.
External keyboard (Not connected, I only use the Internal one).
Screen Blaster resolution enhancer.

Software Includes...
STinG Internet connection software, Configured with Freeserve. Just plug into a phone line and your on the Internet.
CAB (Crystal atari browser) 2.7, WWW browser similar to Netscape.
Newsie, News group reader.
Mymail, E-mail Reader.
Atari-IRC, Internet Chat Software.
FTP software.
Xboot, Boot manager.
MaGIC 6 Operating System.
True Paint.
2 CD's of Software.
Papyrus version 4 (english).
Papyrus version 6 (german).
Calamus.
Everest.
Do It Falcon, Hardware manual in HTML.
50 Mb's of Graphics and Sound Demos, And Falcon specific Games.. Including Substation, obssesion, transartica and loads of others.
50 Mb partition of Music and Music software.. MOD Players and loads of Module files. Mpeg2 audio player. Sample editors and recorders.
Videlity video resolution enhancer(Overscan for RGB monitors/TV's)
Orginal atari disks and Manual.
Backward 3 for running ST games.
Kobold high speed file copyer.
Several Doom clones, Doom2 installed.
NVDI 4.11
Harddisk Driver 7
The list of software on the harddisk is just endless!

I bought the computer a few months ago for �300 and I've put in the 14mb memory module for �100. So i'm looking for around �350 for the lot.

I live in Hereford, UK.. You may come and pick up the computer your self or i will post it to you, You pay the postage.

If your interested E-mail me at: Jonny.UK@usa.net
Thanks, Jon.

Hello

This is the update of the new files available on our web site:

Centinel demo from 07/18/1998
Sandrine demo 4.3 from 01/31/1999

C�cile 2.0.1 from 03/27/1999
cctools 3.0 from 04/01/1999
CENTbench from 08/24/1998
CENTvidel 3.2.4 from 02/15/1999
CENTview 2.9.0 from 25/11/1998
CENTscreen 3.5.0 from 03/16/1999
VIDEOMOD 1.2.2 from 02/15/1999

To install the new flash, you to need to update all the pack of the following items:

PUTFLASH 1.2.2 from 03/24/1999
FLASH.BIN 1.3.0 (c�cile 2.0.1) from 04/01/1999
CBOOT 1.1.2 from 03/15/1999

The big news is that C�cile is now in public domain. So you can install a boot on a hard disk or a floppy (for Tos with big SCSI hard drives).

Hi Lonny!

No there is an option on the connect screen for serial+midi, which is what
I've selected, but although the scanner seems to recognise when the Atari
is turned on (the lcd screen changes) the software doesn't. :(

Cheers!

James

Maybe Atari REMOVED the original SCSI board, because when these were made,
Ataris only had DMA access to hard drives, and SCSI converters such as the
Link weren't available.

Cheers!

If it is any consolation ..I know that the person who bought the exact
same collection (the back up from the library) is having the same
nightmare sorting through his :)

Rather you than me...my eyes would drop out wading through all them
disks :)

Hey,but think of the wonderful time you would have trying all those
programmes that you have never seen before. Heck if you tried them
all you might not get them sorted before the Millenium,if then.

Derek

What a great bit of history :-)

I have just dug out ST World of October 87 which shows how to build
just this drive kit 'for under �300'.

Unfortunately there is no diagram of the ST->BMS card wiring - it just says 'use the cable supplied' :-((

Good luck.

It's not that much of a problem. I'd already knew what I was letting
myself in for as I bought DigiView (that was Byte Back a couple of years
ago).

The hardest part is going to be adding them in a database, so that I
know EXACTLY what I have got;)

I may have to put my plans for a BBS this year on hold; I was suppose to
have it up and running last year:(I'll have to see (fingers crossed)
what happens this year.

I'm a glutton for punishment. As long as I've got one running ST, I'll still be here.

Yes it is an analog RGB monitor that works at NTSC Sync
settings(15khorz,60hzvert)

>Is there anyway one can use a SVGA monitor with the machine?

Only if it is a multi-sync, however there are only 3 resolutions on the ST
machines and the high res is monochorme only. PACMan

I tried to run GT Look without a scanner and it gave me a SCSI
device not found error, so I made the assumption it only looked
there. ;-)

Hi there...

I'm a newbie on the Atari ST (and related products), but as i have got one a couple of days ago i would like to have more info about it... i.e. what kind of hdd is mounted inside a megafile 30 etc. etc.

A faq would be very handy !!!

Berry

Hi Mike!

You might save yourself some time waiting, by sticking any old disk (even an unformatted one) in the drive, and then the desktop will come up really quick!

Cheers!

James

There is no FAQ dedicated specifically to each and every type of hard drive
available for the ST. The Megafile is a RLL or MFM drive attached to a board
that converts ACSI/DMA signals to SCSI, then from SCSI to RLL/MFM. You
cannot replace the drive with anything else than an RLL or MFM drive, but
you can actually put a second such drive inside.

Nicholas

hi,
 I seem to be thinking that these games were released on the ST.
If they were, does anyone know where I can get the St files (running
a pacifist) for these classics? Truly time cannot destroy their
memories. Possible monetary reward.
thanks,
j.

Hi,
I've got a 1040 STe, and it had been working fine, but then I started getting the "Drive not responding" message. At first, if I let it "warm up", it would start to work, now nothing.

Is there anything I can clean, check, tinker with, or is this internal drive shot, and I need a new one?

Where can I get one (cheap)?

I'm in Califonia, USA, by the way.

Thank you very much,
JL

Whats the easiest way to upgrade the STacy memory? Just find 2
one-meg 30pin SIPPs and plug 'em in? Or is there a better way [tm]? How
about to upgrade the processor? Any chance at all? (I've got the Stacy2
2MB)

Hello,

I have a complete Atari Falcon 030 system for sale for 275gbp.
Buyer collects or pays delivery.

4MB RAM, 520MB HardDisk, Epson LQ 100 Printer, SVGA monitor, Graphics
Tablet, loads of commercial and public domain software, books and
magazines. Email me for a complete description.

Michael

Could someone please advise me of the location where I can download the
following file/files needed for connecting an Atari STfm to the
internet, which has a dead link in the Atari Quick FAQ...

HSModem serial port driver

Also, the site linked in the FAQ which has the STING software seems to
always be too busy for me to download from. Is there an alternative site

which contains an up-to-date version of Sting?

Thank you

Fraser

You can download the latest STiNG from my website.Address in sig.Not too
sure where you can get HSModem from...If you still have problems locating
it,mail me and I will send it to you.

Gordy.

The STfm's came with either 512k or 1024k of RAM. These were soldered directly to the board and are located in the front left side of the machine (under the keyboard, on the opposite side of the mouse port). On my 1024k STf, there's two rows of RAM chips, each row having about 8 chips if I remember correctly. Each row is equivilant to one RAM slot and can handle a maximum of 2048k of RAM. Hence, you can have a maximum of 4 megabytes of RAM. Adding RAM requires that you unsolder the chips and solder in new ones of higher capacity. I wasn't daring enough to try it. I don't remember all the details... but for more information you can visit the ST Hardware Hacks page (by Vezz) at:

http://www.freeweb.org/computer/vezz/atari/hardware/index.htm

Note: bookmark it. It took me forever to find it again!

The two chips (where you saw six marked spaces) are your TOS chips. Version 1.4 (Rainbow TOS) used six chips, but later versions only used two. I'm not sure about earlier versions.

For using the internet, I've been told it's possible with 512k or 1024k, but you wouldn't like it. I don't use my Ataris for the internet, so I don't know first hand.

Hope this helps... check out the Hardware Hacks page!

Hi

I want to use the parallel interface via parallel port. What I could do
with is a driver for that port or something!

>Is there an easy way to tell how much RAM is in my STfm?

<snip>

Not as complicated as you make it sound. Look at the sticker. If it's a 1040 it has 1Mb, if it's a 520 it has 512K.

This is unless it has been modified, but you make it sound like it doesn't have an extra RAM board or any hand-soldered extra chips on it. If you really want to look at the board, there are 2 banks, the 520 will have aall the markings for the 2nd bank, but it won't be populated.

The easier way is to download sysinfo.prg from the Quick FAQ. This will tell you how much ram you have, which TOS you run, and sorts of useful stuff you'd like to know.

Nicholas

Hi All!

This is a message to announce the opening of my own website! It's rather basic at the moment, but that's only because I'm a novice at HTML! ;-))

I used a program called Web Wizard, published by Cadenza Software for the Atari series of computers. It's a great program that enables the putting together of web pages with background images and sound files, and I think they look pretty good! ;-))

At present I have four main sections: My Homepages, My Atari Page, Atari Downloads, and a Links section; but I plan to expand these further with new sections.

The Downloads page only has two files to download, and they are Demos for the Atari Falcon, but I'm open to suggestions on what else to put on there. I only want to put Atari stuff there, and not commercial stuff neither!! :) The demos are: Sonoluminesenz by Avena, and The Lost Blubb by Lazer. These can be hard to track down on the Web, so that's why I've put them on!!

The Links section I think is pretty good, as well as Atari websites there are more general stuff there too, including a section of Online Newspapers that are around (only UK ones at the mo'!).

Whats the address, I hear you cry? Well its:

http://www.users.zetnet.co.uk/jfhaslam/index.htm

Any comments/suggestions on the site are welcome, just email to the address below!

Cheers!

James

     Weird; perhaps you shorted something on the floppy controller?

>upgrade and how you subsequently manage. I would also be happy to help
>with my experience of the dismantle and spacing etc etc.

     My first jobs are simple; pop in some SIPPs, and then pop in a
500MB SCSI hard disk. Any tips on opening the case? People have said its a
rough procedure...

          Jeff

Try spinning down the HD or switch of the back-lighting before you access
the floppy and see if the problems persists. You can also replace the old
floppydrive and harddrive with newer and more efficient devices.

PHENIX 060 - Version R1

We enjoy to announce you an updating of our site, particularly important in the domain of the PHENIX, our computer.

Here are the last changes :

1 - the 040 version of the PHENIX is abandoned !
The PHOENIX will be therefore a computer basicly provided with the mythical 68060 at 80MHz, giving 120 MIPS
(040 provides 32 MIPS at 40 MHz!).
Don't be affraid, prices of this 060 have quite changed and we are therefore in measure to propose a 3 or 4 times more powerful machine for only 2000 FF more in the full configuration.
This tariff could decrease according to providing of 060 because this tariff takes account of the worst offer of our suppliers.

2 - LINUX 060 already exists!
Whereas with one or two 040, LINUX would have been just usable, the 060 offers the necessary strength for a comfortable utilization...
Let's not speak of two 060 (240 MIPS).

3 - the DSP56301 works at 100 MHz and its SRAM descends to 12ns. A light increase of cost for 20 MIPS more(by DSP!).
The addition of a daughter card fitted with 3 DSP at 100 MHz is more that ever of actuality with recent and new objectives of some of our customers and partners.
This daughter card will be connected in the PCI slot #3 but it will be possible to add an identical second of it in the PCI slot #2 (the #1 is occupied by the graphic card).
Total, 7 DSP at 100 MIPS each (700 MIPS) and 3 DSP connectors offering each 4 high bi-directional debit serial channels (either 12) of 33Mbits/s for all numeric application ways...

4 - The utilization of SDRAM instead of EDO is essentially reported to an ulterior version of the PHENIX 060 for cost reasons and time of development. The SDRAM supports are 4 times cheaper than the EDO supports (so 60 FFS more) and besides it's necessary to harmonize SDRAM signals in 3.3 V and signals of the 060 bus in 5V with very speed buffers (2ns) and costly (60 FF of supplement).
Total, the added 120 FF on the motherboard compensate the gap of tariff between a 32 Mo SIMM and a 32 Mo SDRAM.
For those that know the 060, it is true that he is compatible with signals in 3.3V, but our PCI bridge is not: what obliges us to choose 5 V for all components of the 060 local bus.

Until 40 MHz as regards to performances, the SDRAM doesn't offer ANY advantage on the EDO 60ns: accesses are made on all sides in 1 cycle.
Between 40 and 80 MHz, the SDRAM makes difference because she always permits BURST accesses in 1 cycle whereas the EDO obliges accesses in 2 cycles (that why the SDRAM imposed itself on computers where processsors reach 66, 80 MHz, and more...

On the PHENIX 060, the only way to take profit from the SDRAM is to pass

the 060 in ' FULL SPEED' mode on its bus.
It means that instead of accessing the bus to an half frequency of its
execution units (in our case 40 and 80 MHz), the 060 would access the
bus to the same frequency than its units, so 80 MHz.
The gain is immediate: with EDO 60 nses, we can access at 80 MHz in
BURST in 2 cycles, whereas the SDRAM offers 1 cycle.
It means that the 060 bandwith in RAM is 2 times more important !
Unfortunately, our PCI bridge can't be matched with the 060 beyond 45
MHz (verified timing for CENTEK by manufactory), what obliges us 060
accesses at half speed (HALF-SPEED mode) in bridge (toward the PCI bus).
We have a solution to this problem, but it will be for a little bit
later, even though the challenge to wire a 060 in full speed on the
SDRAM is exciting enough because that has never been achieved!
Imagine that the 060 in FULL-SPEED mode at 80 MHz is able" to swallow "
320 Mo/s with BURST of 1 cycle 80 MHz!
On Phenix R1, we should be sufficient with BURST 1 cycle 40 MHz, so 160
Mo/s... It is already excellent.

The PHENIX should be produced from JUNE 99.

For all question, we recommand you to visit our site before addressing
you to our services, because we are already overflowed by numerous
questions...

Thank you for your attention.

hi,
is there anyone who can help me with a printing problem.
Someone has given me a canon printer lbp 460,i have tried
running it with nvdi3 but have had no luck.
can anyone help!!!

cheers Paul

Ahh. So its something I'm not going to come across then :)

What about the PAK? Whats thast? :)

>I hope your Stacy has simm sockets not sipp holes. 1mb x 8 or 9bit

Ah. Thats the rub. We couldn't open the back right, so you have to go the top, from the back left. That makes sense, since they wanted to charge by the hour for repairs :P

Thanks for the tips!

I'll try again once I get some suitable RAM worked out.. so I can upgrade the disk and the RAM.

Jeff

14meg Atari Falcon030, audio mods done; 2.1 gig Micropolis external SCSI drive (A/V specs); Soundpool FA-8 (eight audio outs) box; Logic Audio Falcon w/LOG3 interface (adds 3 more MIDI outs); external SCSI CD-ROM/Syquest 44 (w/one cartridge) housed in one box; Wizztronics cartridge port expander (from one to four); two mice (one original, one ITSA); joystick; trackball; tons of discs including some Iomega Zips with commercial, freeware, and shareware SW; and serial port A-B switch. Would prefer to sell as package, but will piece out. Shipping is from Milwaukee, WI. I love the Atari platform, but am selling the last of my three systems as I continue to upgrade my new PARIS-equipped recording studio. I have many references on the web, including several Atarians both US and abroad. Please feel free to e-mail with offers and I will respond immediately. Don't forget to include your address and phone number. Thanks! BTW, the highest offer does _not_ necessarily mean anything to me. I want this gear to go to people who appreciate the inherent quality of the Atari system. Don't get me wrong, I want to make $$$ (maybe even $$$$$:) from this deal, but I also don't need to sell to a jerk who won't use it. Socialist panty-waist? Not hardly. Objectivist? Proudly.

I assume that the printer will print plain text sent to it from the desktop. If so, all you need do is try likely looking drivers from NVDI until you find one that works. It may be that you can set the printer to emulate another - Epson or Hewlett Packard would be favourites.

/|\ Scheduled Chat Sessions

Visit our club website and Click the Main Chat Room menu option to join us for the scheduled chats.   Chats are schedule every Saturday night at 8:00PM CST.� Please stop by for a while.�

We are asking Kent Kordes, Systems for Tomorrow to join us. From my experience, Kent has been a wonderful distributor of Atari hardware and software here in North America. Not only does he carry products for the ST computer line, but the Jaguar and Lynx systems as well! Got a question about products and the future products being released? Stop in and asked.

```
  |||    ATARI USERS OF NORTH TEXAS
  )|(    http://www.atariusers.com/AUNT
 / | \   Read the News, Join the Chats, Share the Meyhem!
```

Also....

We have a project going on right now to build up the Atari fandom in the United States, Canada, and other parts of our dear land mass. The belief is that there are many Atarians out there going on without a user group when hundreds (maybe thousands) of people still use Atari computers.

So if you are in America and Canada especially, just send your name, E-mail address, and State to:

Greg@atariusers.com

We'll be setting up a webpage soon. Who knows? A user group may be just waiting to be started in YOUR AREA!

Howdy.

I stumbled across an old ST floppy of mine the other day but can't read it with the PC because it was formatted a weird way. All I know about the disk format is that it enabled me to cram 990k onto the floppy. (Great idea at the time - not really future-proof though. Ho hum...)

If any of you clever lot out there know of a way I could get at the data on the floppy using a PC alone (haven't got access to my old 520STFM) I'd be more than chuffed. I'd even buy you a Combustible Edison.

Thanks in advance,
ALAN.

I know that people have done this. I would like to, but first I want to hear from some people who have done it.

Any info or thoughts appreciated.

MadCat13

Hi All,

Just got my copy of the mag through the door this morning - Thanks guys !

Unfortunately, it seems that a couple of pages did not get printed for some reason or other (22 & 35).......

Nor did my copy have the Sharwood flyer mentioned in the SAMS99 article.

I enjoyed the last show but, regretfully, will not be able to make it to Stafford this time - see you all again in November, though !

Have Fun.

Jim.

Hi James!

Odd that! My copy also has some blank pages, though in my case they are page 9 and 48. Page 9 I can live without, as its the Readers Offers page, but page 48 is the first page of the Maggie pages, which is my favourite part of the mag.

If Joe Connor or Mike Kerslake reads this, any chance of a photocopy of the pages?

My Sharward flyer was also missing, but as Sharward Promotions sent me a few in the post recently that won't matter.

Cheers!

James

HELP!

My atari 520stfm motherboard has died while converting all my Cubase files
to midi file so that I can use them on my PC.
Has anyone got a programme that will convert?
50 floppies still to go!

Thanx

Trevor

Does anyone use calamus 98 on a Falcon. It wont seem to run properly in 256 or true color. I tried installing a program called falcon8.prg into the auto folder (since this program came in a auto folder when I bought the program from MGI). At boot up when the falcon8.prg is installed it always gives me 2 bombs and i have nothing else installed. The only thing installed is x boot but all autos and accelerators are turned off except falcon8.prg. Has anyone got good advice for me. please help!

Gene

Hi Hallvard.

The web page is up and down infrequently. Howard Chu says there are a number of changes going on over the last few months. There was an upload on the ftp site for testing a month ago. Perhaps it was Dan Ackerman? I am not certain. The ftp site is not erased as far as I know. We just can't seem to access it. I will let you know as soon as there is a change.

Therefore keep everything status quo for the time being.

Later Brian.

P.S. and thanks for maintaining the ftp site listings.

Which is this "recent STinG version"? And what patch is required to TOS?
I have STinG 1.15 and it works nicely with TOS2.06, as far as I can see.

Thanx in advance.

How about using the open source "sox" package as a starting point and optimize
it if you think that you can speed it up?

Hi you all.

A new spring,
a new version of the this interactive disassembler.

You now can:

Mark 16 bit PC relative jumptables and generate corresponding labels.
Quick find the approppriate indirect jmp's and jsr's.
Give names to 'absolute word' operand addresses.
Give names to standard labels.
Attach a short comment to an address.

It is on my web page: http://people.a2000.nl/hrobbers/Homepage.html

Have fun

Henk Robbers.

I installed the NOVA-drivers after I installed NVDI 4.12, but when I recently installed 5.0 (and later 5.01 and 5.02) it didn't care about the Nova.

Anyway, that's a rather braindead way of doing it since you might want to boot without the graphics-card driver but with NVDI... NVDI should simply check for known VDI-cookies before it loads it's own screen-drivers.

> program. Unless it has been updated sence then, it renames the NVDI drivers,
> but you have to manually go back and rename them if you want to use them

My program will rename the drivers to *.SYX if the Nova-cookie is present,
if the cookie is absent it will rename them to *.SYS. So as long as
NVDI_TGL.PRG runs after MENU.PRG but before NVDI.PRG you can boot with and
without NOVA-VDI without problems.

:) I guess thats why fVDI is being worked on...

I didn't RTFM. I never tried to use it without dumping the NOVA cookie first.

The point with this program is to disable NVDI's screendrivers if Nova-VDI is running, and enable the screen-drivers if Nova-VDI isn't running. This way I can boot into both the Videl and Nova without having to manually rename the screendrivers.

Hi Leute

Hab folgendes Anliegen:

Hab mir ein 08 / 15 - Keyboard mit Midi - Schnittstelle (in / out) ausgeborgt und m�chte es an meinem PC (233 MMX, Win95, 64MB Ram, AWE64Gold) betreiben. Nun habe ich folgendes Problem: Ich schaffe es nicht, am PC �ber die Soundkarte irgendeinen Ton des Keyboards zu h�ren, geschweige denn einzuspielen. Ich m�chte Midi - Daten ins "Cubasis AV" u.�. einspielen und dort weiterbearbeiten. Nur habe ich dabei anscheinend irgendein Treiber- und Installationsproblem, bei dem ich anstehe. Die Verkabelung pa�t 100%ig, nur ich kann der Soundkarte keinen Ton entlocken. Nun meine Frage: Was mu� im Punkt "Multimedia" in der Systemsteuerung alles installiert sein, da� ich die Midi-Daten, die ich in den PC schicke, in Musik umsetze? Was mir aufgefallen ist: Beim Mischpult (Play Control) ist der Punkt "Ton aus" bei Midi deaktiviert. Vielleicht weis irgendwer eine L�sung f�r blutige Anf�nger wie mich, denn ich hab (bis jetzt noch) absolut keinen Tau, wie ich das machen kann. Weis wer Rat? Wenn geht, bitte Antwort an meine e-mail-adresse klaxmax123@yahoo.com

Herzlichen Dank f�r die M�he,
Sascha

Okay, I have a question. Can you use a null-modem cable (and if so, where do you get them - Redmond cable?) to hook up a TT that is running MiNT, and a Mega ST that is not? Do both machines have to be running MiNT?

Examine this scenario: The TT is runnig MiNT, will have a static IP adress on the 'Net, and needs to be able to communicate with the Mega ST in such a way that BBS software on the Mega will recognize the incoming call from the TT as a phone call and then respond to it.

All help is sincerely appreciated! ;-)

NO, the Mustek Scan Express 6000P is a scanner with paralel interface,
you need a scanner with a SCSI interface....

Scanners wich are OK:
Mustek Scan Express 6000SP
Mustek Scan Express 12000SP
Mustek Paragon 1200SP

Get the drivers from NOVA instead of HOMA, cheaper and more recent...

Cheers from Belgium

Can anyone tell me why pagestream, calamus and image copy will not print
the bottom portions of a 8.5 x 14 page.  I have set the printer settings
and even put "legal" in the pagestream special command field, I have set
the settings in Calamus sl and yet all of them seem to just skip it and
treat the page like a 8.5 x 11.  If anyone knows of any auto prg i need or
something like that then please let me know.
im using a deskjet 660cse (which is reall a 660c).

thank.

I had Ghostlink working on my Falcon and PC. Its not 100%
stable but its pretty good although its hopeless if you
don't have any serial software like hsmodem installed. I get
20k a second connection speed. So approximately disk drive
speed which isn't too impressive.

Obviously you need the right type of cable and you might
need to run pcslave from the dos prompt.

You also have to setup a drive to be the ghostlink
connection.

Sears Super Arcade II This is VERY RARE and hard to find for those who don't know what it is. It looks like the Atari 7800 but only plays the 2600 games. And, it has four ports for four contollers. This is a really cool system. The controls are shaped like a rectangle and are two way controls. You can us them as paddles or a joystick. I only have three controls. Eveything is in good shape. This is a must for any collector. I will also will throw in a few games. they are Target Fun, missle Command, Asteroids and Space Invaders these are all Sears games

Email offers to

katom96@aol.com

thanks Tom

Hi

I'm experimenting with some disk archive procedures, and I need a parameter file for Dungeon Master.

I have tried the ones supplied but they fail with flying colours.

Any help is much appreciated.

I have the following ST equipment for sale:

2 x Atari 520 ST Power Supply $20.00 Each
Atari SF FDD Power Supply $10.00

Atari ST to SCSI Host Adapters $25.00
Supra ST SCSI Host Adapter $35.00
(this is the one w/o the clock)

Astra ST HD Host Adapter $35.00
This is still in the box that it came it. The power supply is shot,
but if you want to put a small power supply in, you have a ready-built
HD system for your ST. Just add HD.

Magic Sac w/Translator One Box / All Cables / Cart w/ Mac Roms
w/Disks. I don't know if it works, but it used to.
$40.00

Z-Time Chip (Real Time Clock) with Software $15.00

QMI Desk Cart $10.00

All prices are "plus shipping."
All items are in Durham, NC USA

Hi Dennis

Well the guy said it was a SCSI but his using Windows so what can you expect?
Anyways thanks for the clarification.

Hi everyone,

I'm looking for a copy of Cubase for the old Atari 520ST/fm computer. I've used it before and it's great! I recently picked up one of these old gems and want to fire the synth on my secondary sound card with it.

I am willing to trade PC software or trade my exceptional talents as a MIDI drum programmer. This the most common fault with most MIDI-based music I hear - no funk! I can make that s**t sound REAL, man. email me if you'd like a sample!

Thanks
JD

You'll need a memory upgrade to run Cubase on a 520, you could try Sweet 16, that should be OK, and it hasd as very similar feel to Cubase, buit it doesn't have some of the advanced editors...

Hello,

I have just acquired a dusty old Atari 1040ST. There is a 13-pin monitor socket on the back - is this for an RGB monitor? Is there anyway one can use a SVGA monitor with the machine?

Geoff

Not possible. This server is only one of the computers in the domain
rma.ac.be
Each computer has already a DNS name, but the name for the ftp-server at
the moment is as difficult to remember as the numbers.

Greetings,

Saka

Since I don't have the time to use this computer, I'm selling it for
someone who'll use it.
Here's the specs..

Atari Mega STE - 4MB Ram, 40MB hard drive that was just replaced,
keyboard, mouse,
power cable.

I'm asking $100, buyer pays shipping. I'll most likely ship UPS Ground
COD. That way, the
buyer gets the computer in hand before paying. Any interested parties,
email me.

OUCH!

How do I upgrade the memory? I'll try to find out on my own, but I don't
suspect it'll be easy.

I have the following for sale. I prefer to sell the whole lot as a package.
However, I am willing to sell individual items but the ST must sell as a unit
and not as parts.
Here then for your viewing pleasure is a list of my ST stuff :) :
HARDWARE:
4mb 520ST with SC1224 color Monitor, SF314 Floppy Drive, mouse, joystick, Alpha
Data trackball, manual, System & language disks, and mouse cleaning ball.

GAMES:
GBA Championship Basketball The Sentry
MetroCross Star Glider

Guild of Thieves Star Ray Shadow of the
Beast II
AD&D Hillsfar Gold Runner II
Station Fall Golden Path Grid Iron
The Black Cauldron
Battleship
Pirates of the Barbary Coast Flight Simulator II

APPLICATIONS:
Habba Check Minder H&D Base Hippo Pixel
Hippo Fonts Cyber Sculpt Art & Film Director
Multi Desk Calamus Outline Art OutBurst 3.3
VIP Professional Flash That's Write
v.3.1G

Atari Logo

BOOKS/PUBLICATIONS:
ST Basic Source Book
A Source Book for Atari Logo

BTW, I am not leaving the Atari scene.

You can connect any SM124 (MONO), SM1242 (RGB).
VGA Display must start with 15Khz! -> NEC 3D as example.

ODIT_ST contains any cable adaptor, colorised schematics,

Regards, Robert

There's details of a 4Mb upgrade on the DOITF030 archive, sorry can't
remember the URL...

ASP will be selling them soon, but ifg you're in the states then the
postage and currency fees will make it a non-starter....

Yes, I noticed there is no forward or reverse name mapping on this
name - and I looked at whom the range of IPs belongs to.

If it is OK with the authority, I can give forward name mapping to
this... i was thinking of something like atari.cybes.co.uk ? Would
that suit people? short and sweet?

If so, email me and I'll complete the task in hardly any time.

Regards
Danny

i have a syquest syjet as well connected to my Falcon. What else do you have in the Scsi daisy chain? The syjet had problems when the chain wasn't properly terminated. The manual also syays not to locate it after a cd drive. It didn;t like the termination I had on a Toshiba 5 gig I had bought from Toad computers. Try running it all alone See if that helps. It has auto termination built in. It also operates in two modes according to Syquest, one for regular data and one for streaming (according to syquest) although,as far as I know, there is no setting for this on HD. ALSO, check the cables!!!! Are you getting weird filenames?, could be the cable or lack of proper termination. Without knowing your setup its hard to tell. I went through a lot of crap getting mine to behave until I cut back on the number of devixes I had

```
in the Scsi chain. This Falcon just doesn't like too many Scsi devises
connected to it. Alex at AY computers told me to limit the number
of devises to 2 or 3 to be safe.

 I have serious hard drive problems, with a syquest syjet 1.5 gig removable
drive. I am a composer and have a whole cd of my work stored on a syjet
cartridge with 3 partitions. I am using HDDriver 7.00.
 I couldn't read any of the partitions at first, but after restoring
partition info I got the first and last partitions back, but not the middle
one.
```

 In diamond edge I get Dos error # 32768 reading boot sector location 1,
then unrecognised boot sector , (whilst trying to choose the middle
partition as the active drive)
I also have another cartridge that I cannot read the middle partition, it
comes up with dos Error #11 Reading directory sectors location 6729 and
9912. (in diamond edge) I have restored partition info on this cartridge
also. using HD Driver.
 Is there any hope that I may be able to retreive any of this data, it's
almost a years work.
Can anyone offer some help,any advice greatly appreciated. 8-(

Sure there's a clock in there! It just resets to zero whenever you
turn the power off! (Just like all the original personal computers).

many people have gone mad trying to open and put a stacy back together again
if the screen is backlit it requires the internal voltage to be converted
to something like 70 volts.forget the battery alltogether
>
>2. Memory. I believe the STacy I've set my eyes on is a 1Mb machine, is it

mine is a stacy 2,it has a trap door for extra memory which i upped to 4
meg special low profile skinny simms from best electronics
>
>3. Is it possible to connect an external monitor and perhaps keyboard?

certainly a monitor,no socket for a keyboard ,if you want to do this what

do you want a stacy for? :-)

Not sure about, but someone told me once that it's just a matter of
getting a quartz oscillator attached to the +5V, GND and DSP CLK pins of
the DSP connector.

Yes, I was thinking of getting Mario's IDE card and try it on mine too.

> 2. Memory. I believe the STacy I've set my eyes on is a 1Mb machine, is it difficult to upgrade? A MagnumST would be great, is this compatible with the STacy?

Compatible yes, but where would you put it? Lack of space is the real problem here....

> 3. Is it possible to connect an external monitor and perhaps keyboard?

There is the usual 13-pin Atari ST monitor plug.

As for keyboard, it should be possible to install a MEGA keyboard without too much hacking, but then again, the built-in keyboard is already _much_ better than the one on my TT, so... ;-)

Hi Chris!

>I'm trying to find out about how the Falcon's DSP port gets external clock
>sources in. I plan on building an ultra-cheap 44.1kHz only DSP clock.

Well, I had the same idea a while ago. Here is some info from the DOIT030 archive:

****

DSP Connector, DB26, three row female:

1	GP0	10	GND	19	R_DATA *
2	GP1	11	SC0	20	R_CLK
3	GP2	12	SC1	21	R_SYNC
4	P_Data	13	SC2	22	EXT_INT
5	P_CLK	14	GND	23	STD
6	P_SYNC	15	SRD	24	SCK
7	n/c	16	cRD	25	GND
8	GND	17	+12v	26	EXCLK
9	+12v	18	GND		

* pin 19 was not listed in the document I read.

EX_CLK I   External master clock

+12v-   +12v power. Do not draw more than 300mA on this pin.

The signals on this port include several high speed clock and data lines. It is therefore essential that developers use correct drive and termination. In general, all signals should be terminated with a ferrite bead followed by a 68ohm resistor in series. This is the same type of termination used inside the Atari Falcon030 on all DSP port signals. A ferrite bead should be chosen that does not begin cutoff until 20MHz to 30MHz. Input signals from the peripheral should be driven by CMOS devices such as 74HCxx or 74HCTxx.

******

Robert Schaffner also wrote that he has opened his DSPclock and that he found "an oscillator, IC na some resistors". Funny, I thought the only
thing inside should be an Oscillator of desired frequency...
However, the +12v supply must be turned into a +5v and that is probably the job of an IC he mentioned. It must be an 78L05;three pins, converts whatever voltage between 6v-30v into a straight +5v and gives max 100mA.
Resistors?! I do not know...(Robert, wir bitten Sie um Hilfe... Welche Widerst�nde haben Sie gesehen?)
Another rather annoying problem is The CLOCK (oscillator) itself. It must be an 22.5792 MHz clock. Where to find such an oscillator?!!! (But hey, I live Yugoslavia... Maybe it is available to you?)
But I think that if you find the right clock and convert voltage there should be no problems, I know some people that have made the External clocks. (but with a 24 MHz osc= 46.8 kHz...)
Anyway, goodluck, and please if you have the time E-mail me your results and ideas, sugestions, whatever...

All the best,

Nemanja.

I have a few questions because I am still having trouble connecting
an Atari TT030 to a Mac with MagiC 6.0. It should work with a
serial cable. One side in the LAN port from the TT, on the other
side in the Modem port from the Mac.

Does STiNG work with TOS? I tried STiNG with a TOS version from 1991,
but it can't find the default.cfg
Should I install MagiC 6.0?
Does Aftp work with STiNG?
How should I setup STiNG to have the two computers communicating
with eachother. It's just to transfer files from 100 Mb...

Thank you in advance,
Fokko Veegens

Put STING.PRG in your AUTO folder, just after HSMODEM (DRVIN.PRG and SCC.PRG). The STING.INF should be in the AUTO folder too, and should contain the pathname where the rest of you STING files are, including default.cfg (C:\STING for example)

STinG was made to work with TOS. It is also MiNT and MagiC compatible.

> Should I install MagiC 6.0?

You shouldn't need to.

I have put a ExtraRAM deluxe with 4MB sim in my 1MB Stacy. The card is
partly located where the battery would be and I had to solder it in
place.

Go to http://www.seagate.com, they have specs and jumper settings for their drives on their page. I just recently installed a Seagate st-32430N on my TT and no problems with it that I didn't have before.

It was described in C't 9/93 (IIRC), the PCB and GAL can still be bought from eMedia. If you want more info on it please mail me and I'll send you the GAL-listing and scans of the PCB and circuit-layout.

First glad to see others coaxing old Stacys to keep going. One comment I've read is about the trackball buttons - I have removed the spring loading provided by the buttons and just rely on tactile feel given by

the micro switches (as an ordinary mouse) Much better.
I have cut and shut the shielding inside mine to accomodate extra
height needed to raise the internal PSU for space for a T28
accelerator in the CPU socket but have never managed to get all
upgrades working together. The last straw when running the T28 and 4mb
RAM and a 248mb HD is when the system looks at the FD as well. I
suspect a PSU component upgrade would solve this but this is too tech
for me. A post here many months ago asking for help was fruitless.
Maybe what I've read about an IDE interface would reduce load and
allow all to coexist ?
I seem to have read hundreds of messages but I have somehow missed
information about Mario and ASP can someone please help me?

Cheers for now
 Bryan

There are a couple of fixes that can be done to get the T28 working properly on ST based machines. There is a text called "Georges Hard Disk Fix" that was included in the SST documentation that details those mods. I have this file at home. Email me and I will send it off for your review.

I could be interresting too, could you send to me the CAL listing and
the PCB, i would like to have a look to this one.
a little question: Which kind of driver can be used with this
interface ?

Thank for your response !

> interface ?

It's 100% TOS 2.06 compatible, so all IDE-capable drivers will work.
You'll need 2.06 to boot from IDE (there are ROM-sockets on the PCB), but
if you boot from floppy or SCSI any TOS will work if the harddisk-driver
is IDE-capable.

I have one of these cards in my Mega ST and it works perfectly. If you don't want to build the interface yourself or can't get cheap parts you'll probably better off buying Mario Becroft's IDE-interface (www.pl.net/~mario/).

I do not understand this part as I have taken my STacy apart many times and have never had to take apart the screen section. I just remove the screws from the bottom and carefully release the clips at the front and sides with a small screwdriver. With the two halves separated there is just enough room to remove the shielding and access the inner workings. the first time I took it apart was to replace the keyboard mylar, that was a long job but just a couple of days ago I had to replace the floppy, and it only took approx. 45 min, and it was back together and working. I have a parts STacy that I picked up cheap and I have taken apart the screen section on it, I failed to see how that would help in accessing the lower portions of the machine. I am not intending to crtizise but I do not understand how this makes the job easier.

You need a mac emulator. The only one I know of is Spectre GCR, which is very good, includes a cartridge for the Mac ROMs. However it only emulates a mac plus with system 6.0 (a 1985 machine) and is out of production for years. Apart from the nostalgia factor, it's pretty useless. Nowadays, the ST has more support than a Mac of the same era.

Can anyone please tell me why my ste or my falcon do not print the full legal page from imagecopy 4, pagestream 2.2se or Calamus SL.

I own a deskjet 660cse and it will do fine with 8 1/2 x 11 but it wont print out the bottom parts when printing legal. only once in a while will it print it if im in (no seperation) and using the laserjet4 driver in pagestream and only the cyan page prints down lower.
If anyone else has this problem please let me know. Otherwise i will assume it is not the computers or the softwares but the printer!

Granted, I have never had to solder anything inside, but the screen plugs in to the motherboard under the internal power supply so you can completely remove the top section if any is required. After, of course, removing the internal powersupply which IMHO is simpler than taking apart the screen section. Again I am not trying to contradict those who have been very helpful, but I an trying to understand why many people maintain that disecting the screen is the easiest way.

hello folks,

Saka is back after a dark connection-less period of 4 months.

This means the "Atari Network Connectivity" pages are also back.
The URL of these pages changed :
http://gallery.uunet.be/saka/atari.htm
So pleace adapt the links on your pages. THX :-)
Well there is a lot going on at the atari-ethernet scene. Maybe we'll
get an ethernet adaptor after all for our beloved Atari computers. More
info on the pages.

Maybe there will be some minor html errors, sorry for that... If you
would see some, would you be so kind to let me know where it's going
wrong?

I also would like to thank Martin "Nightowl" Byttebier for keeping the
Belgian FTP-site up to date while I was gone.
The Belgian FTP site is still available (no plans to give it up in the
near or far future) at ftp://193.190.205.13/atari/
If all goes well, the DNS name should change soon to somethins that's
easy to remember. I'll keep you posted about this.

Friendly greetings,

Saka -- Karl Samyn

What about the rma.ac.be name? I never tried feeding aFTP that name, but I think it works just the same as 193.190.205.13 or am I wrong?

But it's nice to hear it will continue, as more and more Atari ftp servers are closing down :-(

Correct, try with terminal program (with downloads) before for
to be sure that serial cable is correct.

>Does STiNG work with TOS?

Yes, only recent STinG version have problems with TOS, so it crash,
You need so a little TOS patch.

>I tried STiNG with a TOS version from 1991,
>but it can't find the default.cfg

Strange, is a new problem :(

>Should I install MagiC 6.0?

Not neccessary if STinG run correctly under TOS.

>Does Aftp work with STiNG?

Yes, the STinG version.

>How should I setup STiNG to have the two computers communicating
>with eachother. It's just to transfer files from 100 Mb...

Is with sting port CPX, set IP address, protocol and active it.

Hi !

Is there anyone out there who have tried to connect the Atari
to the PC via serial cable and mapping a PC HD so you can
read the info on the Atari ?
I've tried Ghostlink but I just cant get it working. When I try
to reach the HD on the PC the PC just hangs and I must
restart it. Anyone tried something similar
with good result ?

Thanks !

/Slangen

Hi, thanks for checking my message!

I have a 4 meg Falcon and Cubase Audio Falcon 2.06.
CAF is the only program other than TOS on the hard
drive and I'm only using the sequencer portion of it.
Last night in the middle of writing a song Cubase locked
up (suprise, but at least it's not as bas as the PC version!).
I re booted and when I opened the Cubase folder there were
only 2 files of the approximately 40 or so that are part of the
program. One of the to files name was just random non
alphabetical characters and the other was my backup.all
file which was 0 bytes.

Does anyone know what this is about? How does a program
run one minute and the next lock up and erase itself?

I just dragged the Falcon out of the closet after not using it for a
while and formatted and error checked the hard drive and there were
no problems reported and also just for note, I do have the dongle
installed.

Any help will be greatly appreciated!!!!!!!!

Thanks!, Chris

Hi

I've had no problem with Ghostlink. You may try going through the
transfer speeds slowly. To exit the program on the PC end, press the
relevant button.

A few weeks ago a friend of mine gave me an ISA Mach32 card which I was able to put in the slot of my Nova card ... I already own a Mach32 but my surprise was great when I discovered the new one worked immediately though it was not the same model ...
Even nicer I became able to reach newer resolutions and deeper bits : before up to 24 bits and now up to 32 bits ...

Interesting indeed, but can get NVDI 5.x to drive the card and
completely toss out the Nova drivers?

I could not get my Nova to work fully with NVDI so I yanked the
Nova out and replaced it with a CrazyDots card which does.

They work in perfect harmony..... but (there's always a but) there's a mistake in the docs of NVDI. The NOVA Drivers should be in FRONT of NVDI and not started afterwards....
Your auto folder should look like this:

EMULATOR.PRG
MENU.PRG
STA_VDI.PRG
NVDI.PRG
etc....

Latest version of the NOVA drivers is 2.67, If you have anything less, mail me, and I'll send them to You.

Cheers from Belgium
Dennis

I have a 1Mb 16M nova 90 Mhz on a TT.
Can I do the same as you?
I could use more Herzen.
Or did you have the SuperNova originally.

Greetings.
Henk.

The CrazyDots is an ET4000 card, right? The ATI NOVA does not utilize those drivers which are included with NVDI (for the ET4000), but the Computerinsel set for the ATI cards (completely different chip set). I'm sure that fVDI supports the ATI Mach model NOVA cards fitted to a NOVA adapter. I think Jo was surprised that there was something actually interchangable on an Atari between different versions of the same model card:).

What might be confusing within the NVDI setup is the selection of the type of graphics card. If you select an ATI NOVA card, NVDI is smart enough to not install its VDI drivers (actually it renames them), but it is left up to the user to install the correct drivers. It's easiest to install the Computerinsel drivers first, then install NVDI. Even the older versions would recognize the NOVA VDI drivers, and archive its (NVDI) own VDI drivers.

Mike
(I hope I was accurate:).

Since when? NVDI 4.12 most certainly didn't do this, 5.0x don't either. I
have to disable NVDI's screen-drivers myself (with a little program I've
made).

You sure? I'm pretty sure that when NVDI wasn't installed, and the NOVA
drivers were installed (and in the auto folder), when I installed NVDI
4.11r2, the VDI drivers were renamed in the NVDI folder. I've used your

program. Unless it has been updated sence then, it renames the NVDI drivers,
but you have to manually go back and rename them if you want to use them
again (that is what I remember). I'm 99.9% sure that when installing the
latest NVDI, that it does take care of the NVDI drivers upon installation if
you have a NOVA installed. I remember because I didn't have to rename the
files. This was a new installation, not an update.

Well, i use an DMA->SCSI Adaptor called LINK '97
Best what i can found! Works perfectly with all my
drives an CD-ROMs. Using HDDriver 7.x

Use the same (6 devices) SCSI devices on falcon, with LINK '97
on ST, no different handling.

Regards, Robert

So the Nova's VME adapter is why NVDI cannot drive it alone I guess?
Thanks for the offer. Having used the Nova for sometime I grew very
used to the speed. The CrazyDots seems a tad snappier and a much
cleaner installation so I think I'll stay with the CDII card now.

What version of STing is This? I have what I thought was the last off of Peters Web page roughly Jan. 1998 and various later modules. Although I am to stupid to look right now I believe I have 1.12 and 1.15 dialer. And these work fine on my TOS 1.0 (1985) 520 ST with 2 meg and hs modem.

>
>>I tried STiNG with a TOS version from 1991,
>>but it can't find the default.cfg

Check your dialer path and your sting path. Only fool around with the STing CPX and not the NETWORK CPX (which I was doing when I first setup sting over 1 year ago.

Now that I have quite a few computers to network I will play with the rest of STing:-).

>
>Strange, is a new problem :(

>>How should I setup STiNG to have the two computers communicating
>>with eachother. It's just to transfer files from 100 Mb...

You will need to edit your ROUTE.TAB file.

Something like this.

```
192.168.128.2    255.255.255.255  Modem2  0.0.0.0
0.0.0.0          0.0.0.0          Modem2  0.0.0.0
```

For main computer and IP MASQUERADING

Second computer ROUTE.TAB

```
0.0.0.0.         0.0.0.0.         Modem  0.0.0.0
```

However you should just work on getting your internet setup correct first.

For transferring files, just use a terminal prg or ghostlink. But thats another thread.

As far as I know STing works with TOS.

And if patches are required, I would like to know what these are?

Later Brian.

P.S. Oliver should know more about the TOS/STing combination and I may just be very lucky:-).

Of course I use somebody elses overlay;-).
But I am willing to try something NEW.

For I have had problems with the latest overlays not working with CAB 1.5 and my TOS 1.0 setup.

Does anyone know, is Migraph still in business?

They had developed so much for the ST and I'm not sure they ever
really moved into the PC market much.  Are they still around today?

Indeed - Marpet have long since gone out of business, with System Solutions taking on production of their memory upgrade boards. The bigger memory upgrades never made it to the marketplace for whatever reason.

>Only the MAGNUM ST card needs a bit of work done:
I reviewed this card in Atari Computing some time ago BTW.

It might also be possible to solder a DIL socket on top of the processor, depending upon the particular positioning of components etc. However, putting in a socket as you've described is a much more elegant method!

>The card can be bought from SEIDEL Software Service, 199DM for a bare
In the UK the dealer is Nick Harlow (nharlow@cix.co.uk) of 16/32.

A bit late for you now, but I have an English translation of the CBHD
distribution on my web site.

The original archive is still needed if you want to use the driver itself.

Thanks, I'd appreciate that. Sending away the SM194 or trade it for a TTM is not really an option for me because of the high cost. Unless I can do it myself (or get someone to do it locally) the SM is not worth buying.

The Atari Software eXchange

Updated: Thursday 11th March 1999

All prices are in GBP's.

I am willing to accept US DOLLARS (USD) as well as GB pounds for
Atarian's outside of the UK.

I have the following Atari gear for sale. Prices do not include
postage, please

ring for postage costs etc...

Atari ST Compilation Packs
Atari STE Discovery Xtra Pack,
featuring: Final Fight, Sim City, Escape from the Planet of the Robot Monsters, 9 Lives and the Language Disk. 5
Atari 520STE Turbo Pack,
Featuring: STOS, Hyperpaint 2, Music Maker 2, FirST BASIC, Blood Money, Anarchy, Human Killing Machine, Impossible Mission, Dragon's Breath, Indianna Jones and the Last Crusade, Outrun, and Super Cycle. 15

Compilations
3 Each
Top Shots, featuring: Kick Off + Extra Time.

4 Each
Hollywood Collection, featuring: Ghostbusters II, Indiana Jones and the Last Crusade & Robocop. No Batman or instructions.

5 Each
Champions, featuring: Manchester Untied, World Boxing Championship & Jahangir Khan Squash. No Box.
Finale, featuring: Overlander, Ghosts 'n' Goblins, Paperboy & Space Harrier.
TNT, featuring: Xybots, Toobin, APB, Dragon Spirit & hard drivin'.
Star Wars Trilogy, featuring: Star Wars, The Empire Strikes Back & Return of the Jedi. NO box.
Mega-lo-Mania & First Samurai.

Adventure, Strategy, Puzzle & Trivia type
1 Each
Spidertronic
Tau-Ceti. No box or instructions.

2 Each
Archipelagos
Crash Garrett
Deflektor
Go-Moku/Renju
Quizam!
Skweek
The Quest for the Time Bird
Tower of Babel

3 Each
Advanced Dundgeons and Dragons 'Heroes of the Lance'. No box.
Borodino
Chess Player 2150
Corporation
Curruption. No Box.
Driller. Including a model of the planets surface.
Dungeon Master Editor. No box.
Dungeon Master Expansion Set #1 - Chaos Strike Back & Utility Disk.
Federation of Free Traders (F.O.F.T.). No box.
Last Ninja 3
Lords of Chaos
Murder
Populous

4 Each
Operation Stealth

5 Each
Dungeon Master
Kings Quest I. No Box.
Kings Quest II. No Box
Kings Quest III. No Box.
Buy all 3 Kings Quest Adventures for 15 inclusive of postage (UK only).
Leasure Suit Larry in 'The Land of the Lounge Lizards'.
*** WARNING ***
Leasure Suit Larry contains ADULT Material. Parental guidance is suggested.
Shadowlands
Space Quest. No box.
Terrorpods

10 Each
Frontier - Elite II. 1 meg.
Indy - Indianna Jones and the Last Crusade 'The Graphic Adventure' (6 disks).
I've no idea if this needs 1 meg! It comes with The Arcade game as well.
Populous II. Both 1 meg and 512k versions.

Simulations
2 Each
Hunter Killer

3 Each
Falcon The Mission Disk Volume 1.

5 Each
Battlehawks 1942
Falcon. The F-16 Fighter Simulation. �7 including Mission disk 1.
Flight of the Intruder. Additional Features for 1 meg owners.
Mig-29 Fulcrum. 1 meg needed.

7.50 Each
Flight Simulator II. Including Western Europe Scenery disk.
Formula One Grand Prix (Microprose)
Gunship

10 Each
Reach for the Skies. 1 meg.
Silent Service II. Requires 1 meg.

Sports
2 Each
Football Director
Hyperbowl. No Box.
Super League Soccer
World Cricket

4 Each
Kick Off 2 + World Cup 90

5 Each
Sensible Soccer. 1992/3 Season Edition. Computer Game of the Year 1993.

10 Each
Championship Manager End of 1994 Season Data up-Date disk.

Comes with Championship Manager (1 meg) and Championship Manager Italia.

Altogether 8 disks.

Arcade
1 Each
Hard Drivin'. No instructions or box.
Nitro Boost Challenge

2 Each
Alpha Waves
Bad Company
Ballistix
Cabal
Defenders of the Earth
Fast Food. Featuring Dizzy.
Flood
Formula 1 Grand Prix (not Microprose)
Hard Drivin'
Hong Kong Phooey
Mean Machine
Outrun. No instructions, you don't need them.
Popeye 2
Robocop
Steg The Slug
The Light Corridor
Whirligig
Yogi Bear & Friends in the 'Greed Monster'

3 Each
Awesome
Championship Wrestling
Barbarian (Palace). The one with gladiator 'Wolf' on the box.
Barbarian (Psygnosis)
Cap'n Carnage
Captain America. No Box.
Chase HQ II. No Box.
Defender II
Dragon Breed
First Samuri. No Box.
Golden Axe
Harley-Davidson 'The Road to Sturgis'
Hudson Hawk
Impossamole
Mach 3
Menace
Operation Thunderbolt
Operation Wolf
Oxxonian
Prince of Persia
Risky Woods
Robocop 2
Shadow of the Beast
Speedball 2
Spindizzy Worlds
Spitting Image
Star Breaker (Brand New) Still Shrink wrapped.
Star Wars
Switchblade II
Teenage Mutant Hero Turtles
The New Zealand Story
The Simpsons - Bart V's The Space Mutant
The Untouchables
Thunder Blade
Total Recall
Vigilante
Wizkid. No Box.

4 Each
Ghostbusters II
Lotus III

5 Each
Street Fighter II
Millenium 2.2

Hi,

Does anyone know of any graphics cards, or CPU accelerators
that are/or have been available for the Atari ST/STe? Any web
sites where these things are detailed? I know of the new clones,

etc but wondered if there are any actual add on boards/etc.

Thanks

Bob.

Here I am again:

To attach an RGB monitor to the Falcon030. WHAT setting should M1 and M0 be?
This would be a Magnavox 1CM135, 15.75KHz.

Thank you very much! Please respond via email!

Jim

The only STe one (apart from old stock PAK68's etc) that is available right
now is the Veloce for the STe by the Upgrade Shop. There is a 68030 based
accelerator being designed at the moment, release hopefully in teh late
summer, it'll have VGA, IDE and a lot of extra RAM too, TT processing  aand
better than Falcon graphics is the aim...

> What rights do they have?

In terms of the UK. Copyright exists automatically in a copyrightable work until the author/creator has either been dead (I think it is now 75 years), or he passes the copyright onto someone else.

He has the right to copy the work and to prevent others from doing so, hence 'copyright'. If a person is violating copyright the author may apply to court for an injunction and damages. (Violating an injunction is contempt of court and hence imprisonable.) In the UK a court will NEVER make punitive awards, damages then will be limited to the amount lossed directly and indirectly as a result of the violation - containing no element of punishment.

Essentially that is all there is to it.

John.

If it is an original 520 ST your machine most likely needs a TOS 1.0 floppy. The very first 520's did not have TOS in rom. I used to have one before I got my first Mega ST. I will check to see if I still have the disk (will have to do some digging)

E.g. with my normal 3com 56k Modem I get 19200 all the time.
And 56k modems aren't that expensive these days.

I used a Zyxel modem with 14.4K before and imho it is a
difference...

> Software
> -A proper serial port driver: HSModem
> -A TCP/IP stack and dialer: STinG
> -A mail/newsreader: Newsie
> -A WWW browser: CAB
> -Any other client, FTP, IRC, telnet...

Btw. do some others have the same problem:
sometimes some not-so-good-software has problems
when connecting to the net.
In the end I cannot use the Quit or Exit of the program
but I can use the ACCs.
Now when I reboot, the timing and cost information from the
dialer(CR by Rottengatter) is gone.
Are there any ACCs that do a hangup and write the
appropriate DIALER-information for connection-time and
costs to the appropriate file?

Thanks in advance
ME

Some drivers have been written for CuBase Audio Falcon to take
advantage of a few MACintosh MIDI interfaces and such. I'm not sure
the 'exact' devices supported, but there are some.

>> 3 What is the easiest/cheapest/best way to give it more Ram??

>A second hand RAM board would be the cheapest, either the Atari one or a
>3rd party SIMM board, but these are all hard to come by.

I recommend checking into a Centek Centurbo II card...
One of these will not only take a ton FAST (or TT) RAM of memeory in
the form of SIMMS, it will also boost your Falcon to 50mhz range!

For a less expensive card, I seem to recall a FAST RAM card that
isn't very expensive. This may be a better option since it is FAST
RAM, and would world with NOVA graphics cards and the like. Check
out HOMA systems, as Nima usually keeps some of these in stock.

Dear Fellow Atari-philes:
I'm an owner of an orphan Atari 520ST (w/color monitor) that
may or may not be using
the 512 KB upgrade soldered in it.

What I need:
I'd like to connect the high speed port to a hard drive.
What's still available?
Can I jury rig an IDE drive to the bus? Or SCSI?

After that is achieved, what's available in C and C++

compilers for
the Atari?

Lastly, if I need pub domain MIDI editor / sequencers
for it to make it somewhat more useful with my sound
machines.

Dream list:
Copy of developer's kit documentation and software to use in
porting
LINUX to it. OR. Linux kernal compiled for ST.

IS there any company making upgrade motherboards for the ST?

please email to me 'cause I may not be able to download it
from this
site in time.

There is an IDE adapter board for internal 2.5" IDE drives, depending on what type of ST you have (STE/STF). Then there are SCSI host adapters for external drives.

> After that is achieved, what's available in C and C++
> compilers for
> the Atari?

Pure C or Sozobon C which are commercial. Then there's the good old GNU stuff.

> Lastly, if I need pub domain MIDI editor / sequencers
> for it to make it somewhat more useful with my sound
> machines.

The only freeware stuff still supported is Sweet16, which is pretty nice, but doesn't compare to the serious apps like Cubase or Notator.

> Dream list:
> Copy of developer's kit documentation and software to use in

Linux requires an 030, an MMU and an FPU, plus lots of RAM, non of which you have in your ST, I'm afraid. There seems to be a 68K version out there somewhere, but it's an unstable beta.

> IS there any company making upgrade motherboards for the ST?

Not that I know of anymore. It would be cheaper to get a faster machine, like a Falcon or a TT.

> please email to me 'cause I may not be able to download it
> from this
> site in time.

In time for what? Sorry, but if you have the time to post a question in here, and we take the time to answer you, you should be able to find 5 minutes to come in and check your replies. Besides, if you had done that before, you'd probably have found the answers to most of the questions.

Nick

Hi

I can also get them from Maplins at between 13-20 GBP.

The problem I have is that, as my posting suggests, I am short on
funds:(

I use a Hayes Optima 288, external. Can it be flash upgraded to 336? I have trawled the web and found various FTP sites - but which file to down load? I assume I'll need access to a PC.

Don't be fazed by the PC mob. I down loaded a 870k PDF manual for the modem last night in only 31 secs. and managed to display the first 7 pages in GEMGS (in 15 mins). Anything they can do we can do - albeit a bit slower.

This is Mario's ST and STE to IDE host, very stabel, very fast too...fit
entirely internally ...

Try for a S/H reall copy of Cubase v2 or upwards, you'll need more memory
thank 512 kb though....

There is a 68030/VGA/IDE/TT-RAM board in devlopemnt ATM, projected release
is this summer/autumn.....should work with Linux68K though...or someone
will port it....

Ditto.....read the manual, read the FAQ, read the NG.....

Engineers can ignore point one unless as a last resort :-))...if all else
fails read the README.1ST file...:-)))

Most of the upgreade files are straight Hayes commands and can be sent from
a terminal program to the modem....sounds strange but it works....

I've lost responses before reading them because the usenet bumped them by the time I got back on.

Chill out...

Hello!

The Atari Users Group in Northeast Ohio, USA, is meeting at
7:30 PM at Peoples Community Church, 631 North Rocky River Drive,
Berea Ohio. This also includes 8-bit users too. I am brining my
Falcon030 setup, to demo and show.

Any questions, feel free to email me.

Regards,

Jim W. Krych

Scheduled Chat Sessions

Click the Main Chat Room menu option to join us for the scheduled
chats. Chats are schedule every Saturday night at 8:00PM CST.�
Please stop by for a while.� Note the special chat nights listed
below.�

Saturday, March 13th 8:00pm (Central Standard Time USA)
We invite Roger Burrows, Anodyne Software, maker of
ExtenDOS to join us to discuss his newest software and support
of other Atari products as he champions one of the biggest aspects
of current Atari users--compatibility.

THAT TONIGHT ON HTTP://WWW.ATARIUSERS.COM/AUNT

(PS: We would like to set up a chat session during the European hours
for our site since many have voiced an interest. If you would like to
be our guest or know of someone who would be a good guest speaker,
contact me at clu-da-bard@geocities.com)
